Hegel marches to the goal with great deliberation. This paragraph gives only a clear statement that the Beautiful Soul must confess its hypocrisy, and a clear definition of hypocrisy as the conscious admission to oneself of what one does not confess to others.

In Schlegel's "Allegory of Impudence" the Beautiful Soul is accused of wearing a mask; and since Modesty has already accused her of "wanting to *use* me," we even know what the mask is. But why should Goethe's "Beautiful Soul" (in particular) heed this criticism? and under what circumstances would she do so? It is not enough, here, that *we* can see the point, for we are now observing "Self-Consciousness Itself" so to speak; whatever we can learn, it must by definition be able to learn too. Yet if it is the "essence" of Conscience to be quite unmoved by all the different views that can be offered either before or after it comes to a decision, why should the Beautiful Soul be sensitive to the charge of "hypocrisy"? "Such *impudence!*" is exactly the response we might expect.

Goethe's Beautiful Soul is a hard case, perhaps the completely stabilized unreachable case where the "hypocrisy" is as "metaphysical" as the unhappiness. When we take leave of her she is meditating sadly on the fact that her uncle keeps her away from his children, while they are educated in accordance with his romantically "impudent" ideal. She admits to "feeling vexed" and accuses him, in effect, of hypocrisy: "When it comes to practice, no man is tolerant!" she says. She does not reflect that her own desire to bring the children "to intercourse with themselves and with their invisible, one and only true Friend" while they are still young, is the very same intolerance. "Uncle" wants the children to become adults who are in harmony with their own natures, and able to make their own self-creatively autonomous decisions.⁵⁸

This is the only line of criticism I can think of that might move *this* Beautiful Soul to admit that her "vexation" is hypocritical; and the point of my raising it is that she *loves* her uncle, and respects him as a free soul in his way, just as she is in hers. This is the key to the riddle. Schlegel's allegory is a very good "allegory" indeed; not just because the characters are not simply personified abstractions, but because his picture is deeply ironic. The inward experience that is outwardly symbolized can only come to pass in a spirit quite opposite to the one that is portrayed. Only in a community of *loving* selves can "hypocrisy" be experienced and confessed as soon as it is pointed to.

But this "immediate" transformation of good conscience into bad, followed by its immediate restoration to goodness through confession, is not "hypocritical" in the normal sense, at all. It falls under our ordinary use of the concept of "hypocrisy" only as a limit case. For, as Hegel himself makes clear here, "hypocrisy" is

precisely the subjective condition that pays its tribute to the truth, by not confessing its own falsity.

Mr. Bulstrode, in George Eliot's *Middlemarch*, must go on living in the private hell that is brought to perfect fruition by the exposure of his secret, because even when the truth is known, he still cannot bear to tell his own side of the story to his wife (whose love is sturdy enough to survive that disaster).⁵⁹ This is the most completely fulfilled *Gestalt* of hypocrisy with which I am familiar; and we can see that confession—however inadequate and partial—would be the beginning of its *sublation*.⁶⁰ This case shows clearly why the Beautiful Soul's spontaneous confession and contrition proves that its normal state is not "hypocrisy in and for itself."

- 31./662. Nothing happens if the active conscience simply sticks to its guns, or if it simply gives in. If it sticks to its guns, then there is no mutual recognition any more; if it gives in there is no hypocrisy any more. By admitting it is only the "law of the heart" it admits to being "evil." If I follow my self-created conscience in dealing with others, I am mistreating them. Actual conscience is universal in its intent and claims recognition as such.

Mr. Bulstrode is the "evil" consciousness that one-sidedly persists in its conviction. What makes his case "conscientiously" interesting is that Bulstrode himself sees his public exposure, the creation of a "universal consciousness" in his community, as God's final rejection of him. But even in this valley of the shadow, he is as obstinate as Job in his refusal to confess his guilt. The absolute "unlikeness" or "inequality" (*Ungleichheit*) is what persists.

Bulstrode is a paradigm of "ordinary hypocrisy" carried to the last extreme. There is the same "inequality" present between the position of Fichte, and that of the community that called him an "atheist." But here we feel sure that he was *not* a hypocrite, and that it would have been "hypocrisy" for him to give in to the general opinion. The two cases serve only to illustrate the fact that in Hegel's analysis we have passed the point where "ordinary hypocrisy" is in question. All of the abstract arguments about "duty" (and even arguments about the meaning of the word "atheist") have been submerged in the impulse of the Heart.

The moral disagreement that we are concerned with in the evolution of the Beautiful Soul is the clash between two loving hearts. The heart that is "hardened" in this situation we must consider later. The one that "gives in" is easily dealt with. If one party accuses the other of being self-centred under the cloak of altruism, and the accused admits, as soon as the accusation is clearly understood, that it is true, then the moment of "hypocrisy" is sublated as soon as it becomes self-conscious. Pure self-consciousness has a side of which it is necessarily not originally conscious, but of which it can become conscious. It is necessarily *not* conscious of this outer side at first, because that is the side that *others* see, the side of *Dasein*, the side of what is there to be seen. The "creative" Conscience *can* become conscious of this side (as "essential," not simply abstract and misleading) because it exists in a community of self-consciousness which it recognizes or, in other words, there are those whom we know to be as committed to the truth of the Heart (or of love) as we are.

When *they* tell us that we are following our own hearts, and that to follow one's own heart is to be in conflict with the universal law of the conscientious heart, what can we do but confess it? This is the absolute duty of Conscience, to say what it sees and knows.

Hegel does not refer here to the "law of the Heart," but the identity of the dialectic is clear when he says: "For were this law and conscience not the law of its singleness and caprice, then it would not be something inward of its own, but that which is universally acknowledged." We are actually dealing with just one aspect of the Heart's Law, so that to refer to it here directly would lead to a misunderstanding through over-generalization (just as the direct identification of law-guided Conscience with the *Sache selbst* would be an over-generalization of the same sort). The simply rational Heart took itself to be what everyone has equally; and it found that the "law" of most hearts was for the maintenance of the established socio-legal order, with which it was at war. The Beautiful Soul is not at war with anything, and certainly not with the socio-legal order. Even Julius and Lucinde are not violating the law; they could not publicly proclaim their ideal of life if they were.

The conflict of the truly conscientious Heart is only with other Hearts that are as pure and liberated (or as selfconsciously autonomous) as itself. It does not need to commit itself to the irrational, essentially contemptuous, hypothesis of a conspiracy theory of history, because it is not concerned with the heteronomous world at all. It may indeed be guilty of contempt for Reason (as Hegel indicated in the Preface when he said that both "genius" and "common sense" are "trampling underfoot the roots of humanity"); but its moral guilt is subtler, not deliberate, and not even properly voluntary. To put the point in a nutshell, we have now moved out of the sphere of the State, and into that of the Church. What has now to be forgiven is not "crime" but "sin." This was the sharp transition heralded by the guillotine. The pre-Revolutionary world of enlightened Reason (to which the Heart's Law and the *Sache selbst* belong) could not make the distinction between these two universal communities properly.

- 32./663. The universal consciousness is likewise one-sided. It is just *one* law against the other and the "general" law legitimates the "law of the Heart," as well as conceding itself not to be general after all.

The dialectic of the Heart continues; and the violence of the rhetoric that naturally belongs to an immediate conflict of feelings—the violence that produced the Frenzy of Self-Conceit—now becomes important. "Hypocrisy" is a fighting word. In the ordinary rhetoric or moral discourse it is used only when someone's feelings run away with her, or when all hope of an agreement or a compromise is gone. Thus Cromwell was certainly using the language of conscientious desperation, when he besought the General Assembly of the Church of Scotland "in the bowels of Christ, think it possible you may be mistaken." But he might have called them "a conventicle of canting hypocrites" (if I may presume to guess at the language of his thoughts, when the General Assembly did not do what he wanted). They were theologically obligated by their belief in divine predestination to keep the awful

possibility that they were “mistaken” in mind (as the Beautiful Soul is not). But the fact that their own eternal desert or destiny was hidden from them only made it more useless, and even perilous, to speak of “hypocrisy” here.

The fact that there is no curtain for the Beautiful Soul between its life here and its life “in God” is what changes the situation. Now the community that utters the awful judgment must show that it is indeed one that lives clearsightedly in God likewise; otherwise its judgment is not valid. One does not “fight,” even with words, in the presence of God. If I say that someone I care about is just following their own “heart,” I must also recognize the sincerity of the conscience to which I am appealing. There cannot be an “objective” judgment here. Both laws, that of the agent and that of the judging consciousness, are inward “laws of the Heart,” in exactly the same sense. Any pretence that I am in a better position to give the universally valid judgment would be a breach of the universality of essentially loving recognition. It is the *loving* universality that calls forth from me an equally ready confession of the particular (and hence “evil”) character of my condemning judgment. The zeal of “righteousness” is a rupture of love and beauty; and hence it is a violation of the true universality of creative freedom.

- 33./664. There is another aspect to this which is our way out. The general consciousness is not the active one. It observes and judges; it shows the active conscience that it is not “doing good.” But its law is that the good must be done, and it is itself doing nothing. So it can recognize itself, too, in the failure of the acting conscience; both sides are hypocrites *together*.

As soon as the judging consciousness moderates its zeal, and becomes less than totally committed to the act of “judging” the agent consciousness, the other aspect of its own activity becomes apparent to it. It is able to be the truly universal consciousness, the one that is conscious of both sides, precisely because it is “only” an observer. Everything is visible to it: it both hears the conscientious declaration of the creative soul expressing the self-conscious aspect, and sees the finite action that is there to see. Comparing these two, it is aware of the aspect of exclusive self-affirmation in the act (as Goethe’s Beautiful Soul is aware of being excluded from the education of the children). It points this out to the agent consciousness, and the weakness is instantly acknowledged.

“Uncle,” who has already stood in the observer’s position, and said then that “You, my dear Niece, have *perhaps* chosen the better part,” would now have to admit that his “perhaps” was the ironic cloak of a negative. At least, the choice of “we others” (“to become acquainted with the sensuous man in his whole range, and bring him actively into unity”) is the more comprehensive one, and must, in the nature of things, come first in the order of fulfilment. The possible validity of the “perhaps” can only be established later. With this explanation, the “vexation” of the Beautiful Soul ought to pass away, since the whole ambiguity of the situation is now plain, including the “hypocrisy” of her judgment that “When it comes to practice, no man is tolerant.” She wanted this judgment to be accepted in the place of an act, when it was precisely the full act of “tolerance” that was called for.⁶¹

Any other act—specifically the loving intervention in the education of the children, that she wants to make—would be subject to the very same judgment that she passes upon her uncle. But judgment, too, is an “act.” In order to be impartial (and hence “universal”) it logically must be the act of standing aloof and not doing anything; and this is the one active policy which necessarily and infallibly cannot be the doing of one’s duty. So as soon as the observer looks at her judgment on its active, self-conscious side, she must condemn it and confess to “hypocrisy” in turn.

(d) *The Hard Heart (the “Hermit in Greece”)*

- 34./665. *Judging* is an act too; if we look at it that way the mirroring is closer. The claim of the agent that he is doing his duty cannot be denied; every act has its dutiful aspect as well as its selfish side. The judgment chooses to look at the selfish side (which it imputes or adds to what is visible). An egoistic motive can always be found, since the agent does indeed realize *himself* in the act. This valet’s eye view betrays the valet’s presence.

That it is the act of “doing nothing” is not the whole truth about moral judgment as an action. It wants to do nothing, to be impartial, because that is what it conscientiously ought to do and be; but it does not succeed in fulfilling “pure” duty, any more than any other action does. In its attention to the unacknowledged self-interest of the agent consciousness it becomes envious. It is no more “impartial” than the agent consciousness (which attends only to the dutiful aspect of the act in its statements about it). There is no “impartial” judgment in the practical sphere. The impartial judgment would be an “infinite judgment”—one that combines contradictory assertions.

We can recognize here the necessary return of all the displacements of the Moral World-View into Conscience—and particularly the return of the Infinite Consciousness that comprehends all contradictions and must be gracious about them, because it knows that the agent’s “disposition” is good. But at the present juncture the Judge is not gracious, but Mephistophelean. She condemns everything, from an infinity of aspects.

The return of this abstract infinity of points of view is possible, because the judging consciousness has to retreat to the standpoint of “rational observation.” Once it does this, there is literally an endlessly indefinite number of ways in which the action that “is there” can be interpreted as the realization of a private or exclusive “self.” Any observed, or plausibly probable, consequence of the act that is under any aspect “desirable,” can be taken for the actual motive (or objective) of the action. The author of *Lucinde*, for example, achieved almost instant notoriety; and clearly he did want to be “famous.” The designation of oneself as a “genius” is (among other things) a prophecy of one’s eventual fame, and a claim to deserve it. So how can someone who describes herself in that way deny that she wants that?

Every action is capable of this sort of contemptuous evaluation. One can ascribe the delightful sense of having “chosen the better part” (or even the hope of heaven)

to Goethe's Beautiful Soul as her real motive; and no matter how gentle the critique may be—as in the Beautiful Soul's vexation with her Uncle for example—it falls into this one-sided attitude of the moral valet. The saying that “no man is a hero to his valet” belongs to the golden age of the ancien Régime.⁶² Hegel's comment about moral valets (which Goethe picked up from here) indicates clearly that the standpoint of active Conscience is ultimately to be preferred to that of the moral critic.

Paragraph 665 also shows how the aesthetic conception of the Beautiful Soul, in its absolutely creative *isolation*, actually becomes open to the whole world again, in a way in which “law-guided” conviction was not. This was why the standard of political actuality became relevant again in paragraph 658. Inside an actual community of “beautiful souls” the sublation of “judgment” is easy and spontaneous. The Concept abides unshaken, and does not “move” because it contains the “antithesis” *an sich*. But the loving (and readily forgiving) community is only able to form and maintain itself, because it has collectively “hardened its heart” against the rest of the world. The “hard Heart” is the heart of a social idealist, not that of a political cynic. It is good to remember this when we are reading the contemptuous remarks about “genius” in the Preface.

- 35./666. So the judging consciousness is contemptuous; and it is hypocritical because it sets up this other way of being evil as righteousness. The agent can see that it is as evil as he is; so he confesses and expects confession in return, for he is not now abasing himself, but acknowledging this likeness to the critic. This is the linguistic thereness of the Spirit; and he expects the other to contribute his share.

The judging attitude falls back into the world of the shattered consciousness. But it is a Mephistophelean inversion of the “honorable” consciousness, for while it sees only the dishonorable side of all actions, it takes itself still to be *honorable*. As Hegel says, it is “contemptuous”; but it is not self-consciously so (as the Young Rameau was) for it does not despise itself along with everything else. Young Rameau is not a hypocrite, but this “hard-hearted” attitude (being quite stable) is “hypocrisy” unmasked, but persisting as such. Instead of admitting that it is the other way of being evil, it takes itself to be “good.” This is the perfect likeness that the agent conscience recognizes. In recognizing the moral valet, so to speak, she recognizes herself as an ordinary human for whom someone must provide valet service.

This is a universal generalization of the strictly personal relation of Julius and Lucinde criticizing one another, or of Goethe's Beautiful Soul and her Uncle. But that is the point of paragraph 665. Once the acknowledgement of self-centredness occurs, the creative soul is as open as the convinced Conscience was closed in paragraph 650. All the criticisms offered in paragraph 649 can now be recognized as valid in their way; but we have moved up to a higher level of moral comprehension. We know that only subjective laws of the Heart can be in conflict; and we are now concerned with political and historical judgment. The Beautiful Soul is a *world-view*. In its own “world” it is soft-hearted and forgiving; but towards the “outside world” it is resolutely “hard-hearted.”

The newly open Heart of the lovingly creative agent assumes that those who have opened its eyes are as openeyed as it is. When it confesses, it is not subordinating itself to the judgment of another, like the Unhappy Consciousness. It is recognizing *for itself* and explicitly what the Unhappy Consciousness itself recognizes in its externally mediated and implicit way: that its self-assertion is a necessary part of God's plan, that the total pattern of sin and forgiveness is "absolute." So it can still say to the human judge what Luther said to his judges: "Here I stand. I can do no other"; and it expects the judge to say: "Yes, we must all take a stand, and it is wrong of me to pretend that I am standing on the sidelines, for no one can stand there."⁶³

Hegel describes the whole situation in terms of his doctrine that conscientious language is the *Dasein* of the Spirit. When the "reconciling *Yes*" does come, he will call it the "*Dasein* of the *Ego* that is extended to duality" (par. 671); and this is the "descent of the Spirit" (as well as being the only "Second Coming of Christ" that Hegel expects). But this "appearing of the Spirit" is delayed for the moment, still, because the judging consciousness does not yet make its "contribution." Just as the active Conscience was fixated in an apparently impregnable way as active Conviction, so the Beautiful Soul becomes fixated in its universal observer status as the "Hard Heart" (or as Hypocrisy pure and simple). This hardening is logically necessary for the community of Beautiful Souls in its relation to the "outside world." So every "loving Heart" is hard-hearted, because it can only be truly loving in its (particular) face to face relations, not in its universal attitude.

- 36./667. The judging consciousness is not aware of its own evil, however, and will not concede the equality between them. Its "hard heart" must be broken, its narcissistic illusion of beauty must be exposed. The hard heart is not priding itself on its possessions [cf. pars. 519–521] but on its thinking essence, its "knowledge of good and evil." This is the *extreme* rebellion, the sin against the Spirit, since it refuses to recognize *freedom*, and this hardness is all that now prevents the existence of absolute Spirit.

The confession of "evil-mindedness," which Hegel speaks of here, is not the private confession of Julius and Lucinde to one another, or that which Goethe's Beautiful Soul might make to her "Uncle." In the inner world of the Beautiful Soul as a harmoniously self-contained concept, there is no room for explicit hard-heartedness. In that world confession is met by confession, and mutual forgiveness completes the turning of the Concept upon its own axis. But now we are dealing with the Beautiful Soul that encounters the great external community of public life. Hegel has already said, in paragraph 658, that at this level it cannot succeed, that it hears only the sound of its own voice and volatilizes into nothing. The paradigm of that is *Heinrich von Ofterdingen*.

It is Hölderlin's *Hyperion* that shows what happens to a Beautiful Soul who is not content with a merely verbal echo, or with the creation of a magical world of mutual moral self-congratulation. Hyperion tries first the lonely path of Goethe's Beautiful Soul: he goes home to Tina. But he is drawn back into the political struggle, and in that struggle he gains a clear insight into the selfish motivation of those

who claim to be fighting for liberty, equality and fraternity. Then, after seeking death in a battle between two powers who make no pretence to be anything but old-fashioned despots, he becomes the “hermit in Greece.”

This hermit-persona has two sides. In the first place he has poetic dreams of the ideal life that he has lost. In this aspect he does not differ from Heinrich von Offterdingen, except for the fact that his ideal is *in the past*. But this difference is crucial because he must blame the present world for this loss; and so he becomes, in the second place, the “hard Heart.” Having incarnated the Beautiful Soul as an active Conscience in its full universal range, and suffered defeat in the public world, he passes beyond the dreaming and yearning activity of the Beautiful Soul as a harmonious Concept, to become its real antithesis, the contemplative Conscience of the absolutely universal Judge. He condemns everyone else as “selfish”—and here we must think especially of the Moral World generally, where everyone does their best and is deeply conscious of how imperfect it is, so that their “confession” can be taken for granted. This is what happens when Hyperion visits Germany as an observer. I will quote the climax of his attack:

“Everything on earth is imperfect,” is the Germans’ old refrain. If only someone would once tell these people whom God has forsaken that everything is so imperfect among them only because they leave nothing pure uncorrupted, nothing sacred untouched by their coarse hands, that nothing thrives among them because they do not respect the root of all thriving, divine Nature, that life with them is stale and burdened with cares and too-too full of cold, silent discord, because they scorn the Genius, which brings power and nobility into human endeavor, and serenity into suffering, and love and brotherhood to towns and houses.

And that too is why they are so afraid of death and, for the sake of their molluscan existence, bear every indignity, for they know nothing higher than the bungling job they have made of things.

O Bellarmin, where a people loves Beauty, where it honors the Genius in its own artists, there a common spirit is astir like the breath of life, there the shy mind opens, self-conceit melts away, and all hearts are reverent and great and enthusiasm brings forth heroes. The home of all men is with such a people and gladly can the stranger linger there. But where divine Nature and her artists are so insulted, ah! there life’s greatest joy is gone, and any other star is better than earth. There men grow ever more sterile, ever more empty, who yet were all born beautiful; servility increases and with its insolence, intoxication grows with troubles and, with luxury, hunger and dread of starvation; the blessing of each year becomes a curse, and all gods flee.”⁶⁴

Lovers who have withdrawn from the world can forgive one another; but the loving Conscience that has taken the woes of its whole world upon it, cannot forgive. This is the *Gestalt* of “Evil,” the direct inversion of the Beautiful Soul.

Hyperion takes his “Heart” to be “breaking” just when it is in fact *hardening*.⁶⁵ But in his “Empedocles” project, Hölderlin did go on to picture the Hard Heart that really breaks, and “throws itself away for another.” His “Empedocles” was not published yet; and it was destined never to be properly published in Hegel’s lifetime. But I think that Hegel has the suicide of Empedocles in mind, as well as the

Crucifixion of Jesus, the wasting death of Novalis and the mental breakdown of Hölderlin, when he speaks in the next paragraph of the Beautiful Soul surrendering its “being for self” and producing as a result only the “spiritless unity of [inorganic] being.” Jesus is certainly the final figure of the Beautiful Soul, the one who “hardens his heart” in many judgments about this “generation of vipers” and its fate, but is properly the Broken Heart, who prays for their forgiveness on the Cross. Thus Hegel’s own first portrait of the Beautiful Soul (the portrait of Jesus in “The Spirit of Christianity”)⁶⁶—unknown, like Hölderlin’s Empedocles, to his audience—slips into its place as the last of the series beside Hölderlin’s Greek sage.

When Hyperion refuses to forgive, he ceases to communicate. He makes poems of his dreams of “harmony with nature”; and he expresses himself for others in so doing. But the communication is all one way, for he curses those to whom he speaks; what becomes morally explicit in Hyperion’s diatribe against the Germans is the essential “hard-heartedness” of all Romantic genius. The geniuses do not want to communicate in the full sense, because they want to be listened to, but not to listen. They commit the supreme sin, the sin against the Spirit.⁶⁷ Most sinners cannot achieve this because they do not know what (or where) the Spirit is. Like Hyperion’s Germans, the ordinary philistines of Young Rameau’s world are in this situation. They must be forgiven, because they do not know what they are doing. For them it is all a simple matter of money and material goods, not of “the Spirit” at all. But the Romantic idealists, in their determination to keep their ideal unspotted by the world, contradict the fluid continuity of “pure knowing,” and try to reduce it to a personal possession, a *Ding* that belongs to their own élite circle. Their “morality” is at fault, because anyone can enter the spiritual world at any moment. From their own doctrine of creative genius they ought to be able to learn that no one can justly be condemned as a lost soul. Spirit is forgiveness. The self-consciously repentant spirit forgives itself, because it recognizes the necessity, the *absoluteness*, of its situation; and no repentance that contains the recognition of this common lot of humanity should be rejected. So it is precisely the “hardheartedness” of the judge who refuses to listen, and to explain, or the self-satisfaction of the art that preaches the subjective “fragmentariness” of genius, and the magical exclusiveness of artistic vision, that stands in the way of its own millennium.

37./668. This “beautiful soul” is now *stuck* in its negative certainty. It must be actual, but it cannot. It can only go mad, or pine away in spiritual consumption.

Novalis does have the positive knowledge of God and human destiny which he can only communicate to a few pure spirits like himself at the level of “genius.” He has repulsed the world, but he does not recognize that *he* has done it, because he thinks that his alienation from the ordinary masses is partly a simple fact of nature, and partly their own doing. His ideal world cannot be realized, because there is no possibility of “likeness” or “equality” (*Gleichheit*) between the moral genius and his ordinary readers.

In *Hyperion* the fact that the repulse (*zurückstossen*) is the action and judgment of the Beautiful Soul itself is recognized and made plain; Beauty shows its dark side,

and the identity of King Oberon with the Evil One is revealed. Artistic genius cannot create the new world of real life, because it cannot give itself up to the rational equality of ordinary discourse, or to the mutual understanding and forgiveness of subjective bias and self-preservation that is basic to the everyday life of Conscience.

Both of them, therefore, the genius who thinks she does not judge the ordinary world, and the one who knows clearly that she does so, can only give themselves up for the other in the ordinary course of nature. They are caught in the contradiction between dream and reality, because unlike the Beautiful Souls that withdraw into private happiness, they do “dream for the world.” A dream-world is a living contradiction for the actual self of Conscience. This is the immediate shape of the *Gegensatz* to which they hold fast. That is why (as Hyperion knows and feels) they are “unhappy.” Their dream of a universal spiritual brotherhood (and sisterhood, for both of them ascribe a more equal role to woman than Julius does to Lucinde, and they are at one with their mentors Goethe and Schiller about that) is in itself the immediate *Wechsel* (or alternation) of the Unhappy Consciousness (par. 658) raised to fully rational Self-Consciousness.

Hegel says that “immediacy alone is the middle and reconciliation of the antithesis . . . and it is pure being or empty nothing.” In effect, this is saying that the only “middle and reconciliation” is the collapsing together of “pure self” and “utterance [*Entäußerung*] into actuality.” As *pure being* this is the disappearance of the self in death; as “empty nothing” it is the self without a world. On the side of the “innocent” dreamer (Novalis), the resolution of the alternation is into a slow natural death in which the spirit wastes away; on the side of the “guilty” dreamer (Hölderlin) it is into the “empty Nothing” of madness.

Madness is the “death” of self-knowledge, so it is peculiarly appropriate for the “Hard Heart.” I do not think that we can, or should, close our eyes to the intended reference to Hölderlin here. The reference to Novalis was recognized and universally accepted long ago, in spite of the moral ugliness of the apparent suggestion that an early death from consumption was just the fate that he deserved. I hope that I am in tune with my time in speaking thus, for I believe that Hegel himself felt the ugliness of saying the same about Hölderlin’s mental breakdown. He had no personal ties with Novalis; but Hölderlin was for several years his closest friend. And because those years were so crucial in his development, it is correct to say that Hölderlin was the most important close friend that Hegel ever had.

Moreover it is certain that Hegel recognized this. Yet this is not the only place where he connects Hölderlin’s mental breakdown with his philosophical position. For when he comes to the Beautiful Soul in the *History of Philosophy* lectures, he mentions Novalis by name, but says nothing of his death. There cannot, after all, be a demonstrable connection between being a Beautiful Soul and dying of consumption; but there *can* be a logical connection between being a Beautiful Soul and going insane.⁶⁸ So when Hegel said in his lectures that “the extravagance of subjectivity often becomes madness (*Verrücktheit*),”⁶⁹ his listeners and readers who were well aware that Novalis did not go mad, were bound to ask themselves which “beautiful soul” did go mad.

Since Hegel himself clearly felt that it would be shameful to mention Hölderlin's name in the lecture hall, why did he think that he had to make these two unmistakable references in print? The nature of his project excused him from naming names here, but the collocation of the reference that is simply in bad taste with the one that is morally revolting⁷⁰ makes the identification of the latter as easy and as certain as that of the former. We cannot suppose that Hegel had a sick and angry desire to deny his own past, or his own spiritual debt. For the *Phenomenology* itself is directly continuous with that past, and with its political ideals; and we have unimpeachable testimony that Hegel at sixty, sadder and arguably wiser than he was at thirty, still remembered Hölderlin with a vividness that only an abiding love can explain. Princess Marianne of Prussia (whose older sister Auguste had been in love with Hölderlin) recorded in her diary the occasion when the great philosopher, being then Rector of the University of Berlin, had to be entertained at a Court dinner. The Princess—and no doubt the Professor too, though it is not the sort of thing he would have put on paper in a personal record—felt shy and uncertain what to talk about. But all constraints vanished when the royal lady mentioned Isaac von Sinclair, because she knew that he formed a link between them:

I began from him [Sinclair]—then he [Hegel] spoke of him . . . of his own rambles with him upon our mountains [at Homburg], naming each of them by name—then he began from Hölderlin, who is lost to the world—about his book *Hyperion*—everything that had made an *époque* for me in my childhood on account of my sister Auguste's connection with it—and there I felt once more at the sound of this name a true joy—a whole lost past arose through it, and the man as mere sound was to me in that moment truly dear. There was awakened a kind of living memory just as it is sometimes through an odour, a melody, or a single note. I saw once more the book *Hyperion*, as it lay in its green binding on the windowsill of my sister Auguste and the vine-tendrils so beautiful at the window, with the sunshine coming through them, the cool shades in the dark avenue of the chestnut trees, outside the window, I heard the birds—in short the whole lost past arose for me in the befriended name.⁷¹

Perhaps all the magic of this *recherche du temps perdu* was in the lost poet's name—but I think not. For the alarming Professor had the art of *Erinnerung* (as well as a remarkable memory in the ordinary “mechanical” sense); and when the Princess calls Hölderlin's name *befreundet*, she means to link herself and the professor in 1830, with Sinclair and her sister and the poet thirty years earlier.

If we grant that the old love was still there, then Hegel's judgment here must in some sense be an objective or “conscientious” one. In order to grasp its conscientious aspect, we have to remember two things. First, Hegel's Herderian-Spinozist conception of the harmony of Spirit with an order of nature that was rigorously determined; and secondly his admiration for Dante. Thus, on the one hand, Hegel believed *a priori* that the “spirit” of Novalis was in harmony with his naturally wasting body.⁷² If asked to explain how the same spirit could inhabit the healthy bodies of Friedrich Schlegel and Schleiermacher (fellow-contributors to the *Athe-naeum* “Fragments”) he would have said that it was not the same spirit, being in

Schlegel more self-centred (witness *Lucinde*) and less powerfully persistent (witness the conversion to Catholicism); and in Schleiermacher, not a properly “creative” genius at all. The death of Novalis, however rude one might have to be about his effectiveness in this life, was one of the signs that his place in Paradise—or in that “slow procession of spirits one after another” (par. 808), which was the only Paradise that Hegel recognized—was higher than theirs.

In Hölderlin’s case, because he had gone to *Hell* almost before Hegel’s very eyes, and was not yet in Paradise, we need secondly to remember the example set by Dante. Dante puts his old friend and mentor Brunetto Latini in Hell, and foresees the imminent arrival there of his closest friend, Guido Cavalcante. These were *God’s* judgments as he understood them; and Dante loved God, and believed implicitly in his justice. Hegel had no belief in a loving power that sees the fall of every sparrow; but he believed equally fervently in the rationality of the actual, and he believed in Hölderlin’s genius. The author of *Hyperion* was not a sparrow whose fall was of no rational significance. The ethics of actual rationality is not that we must “love fate” (or God) as the Stoics (and Christians) taught. For “Necessity” exists at many levels, and “love” is not appropriate to them all. But “the first principle of moral science is the *reverence* we must have towards fate”⁷³ (as Hegel laid down in 1801). The connection between Hölderlin’s poetic genius and his schizophrenia is as objectively recognizable as that between his revolutionary enthusiasm and his fear of political prosecution. Hölderlin’s fate expressed a harsh Sophoclean necessity, more reminiscent of Oedipus and Apollo than of the God who loves the sparrows. But we must regard it with reverence and be reconciled with it (as Dante was) no matter how closely it touches us.

(e) *The “Broken Heart” (Jesus)*

- 38./669. Recognition and forgiveness is the true resolution. The wounds of the Spirit heal, and the *freedom* of spirit becomes visible. The righteous judge recognizes that he too is only a moment, hypocritically setting up to be the whole. The agent recognized himself, and renounced his deed; the judge must recognize himself, and renounce his concept.

Hegel’s judgment upon the Beautiful Soul and the Hard Heart is itself bound to appear hard-hearted. But we should read it in the context of his doctrine that the Hard Heart can break, and “be raised to universality.” The Hard Heart is *itself* all that is excluded from the universality of its own judgment. So its rise to universality is only the inclusion of itself in the judgment, just as the confessing active Conscience expected (par. 666). Objectivity of practical judgment is reached, precisely when we recognize that all of us, both in acting and in judging, are biassed. We have our own personal concerns at heart, and we cannot help that; it is a necessary moment in the logic of practical concern. So it is possible for us to forgive each other, both for the action and for the judgment; and this freedom of absolute spirit creates the Kingdom whose coming Jesus preached, the Kingdom where “the

wounds of the Spirit heal and leave no scars." What Hölderlin's imagination could so readily do for the Greeks, it can also do for the Germans; not by dreaming of the "beautiful Hermann" of the future, but by seeing the poor, Godforsaken, bourgeois philistines *historically*, and letting the standpoint of strictly *moral* judgment go.

Universally speaking, it is the communal significance of the act that matters. Hegel's dictum that the healing "leaves no scars" sounds like the doctrine that "tout comprendre c'est tout pardonner"; but he does not say that (just as, in fact, Madame de Staël did not).⁷⁴ He is not here concerned with the exercise of pardon (or with Madame de Staël's "indulgence," though that is closer to the position of the comprehensive historical consciousness); the transition that we have to make now, depends upon our seeing the complete *irrelevance* of the moral valet in historical judgment. The agent consciousness which confesses that it is evil must "break" the previously unrecognized "thereness" of its "particular being-for-self" in order to posit it as a moment of the free power of the Spirit over its actuality. That is still a "moral" act within the sphere of Conscience. But the Hard Heart must break its "determinate concept," its previously unrecognized claim to give a universal and objective judgment, in order to have its share in the same *free* self-concept of the Spirit. *This* is the "breaking" of the moral standpoint altogether.

Hyperion sees the "subsisting negativity and boundary" of German bourgeois life; and he imputes the motives of finite selfishness to those who live this life. But if one of the accused confesses that the selfish motive is there, she is breaking the boundary and restoring (in quite a new sense) the conscientiously universal aspect of what has been attacked. For she is (in principle) demonstrating the power of the Spirit to cast off the old life and live a new one. That new life, however, must include and comprehend all of those old (selfish) necessities; and the determinate judgment, its justice being thus acknowledged, must break itself in order to comprehend both the new situation, and its own illegitimate abstraction from the necessary bounds of finite agency. Morally speaking, it must find itself guilty of not acting to create the better life of which it was pretending to be the expression. Through the recognition of the other, it becomes the expression of the real possibility of a better life. Thus, for Princess Auguste, *Hyperion* became a sort of devotional book for a long life of personal piety. She was a kind of "hermit in Germany." But through Arnold Ruge the book became part of the heritage of German socialism.⁷⁵ This *communal* recognition is the "other" of which we are now speaking.

39./670. The judge can renounce his concept because he intuitively himself in the agent, when the agent condemns his own act. "Forgiveness" is the Heart's renunciation of its higher position, or its non-actual essence, and acknowledgement that that action is in itself good. The word of reconciliation is the *Dasein* of absolute Spirit intuiting the universal in the singular.

When the self-closure of the agent's "conviction" (par. 650) breaks open (par. 662), the "unrecognized judgment" receives recognition. The agent recognizes herself in the "action of judgment" (par. 666). This opens the way for the critic to rec-

ognize herself in the repentant agent; indeed, the recognition is much easier because the identity is closer. The agent joins in the judgment, and condemns herself; but the author of the first (enlightening) judgment must now see herself as the agent who failed to act, and gave judgment actively from the standpoint of that failure.

This identity is the standpoint of *Verzeihung*. "Forgiveness" must be reciprocal (as in the Lord's Prayer, where the forgiveness of our trespasses is linked with our own forgiving of "them that trespass against us"). But in the Broken Heart the "forgiveness" rests upon participation in the same sin (under two aspects) and the same redemption (under two aspects). Both parties return into a self that belongs to both (the concretely universal judgment to which they must both contribute before it can exist at all).

Unlike the mutual forgiveness of Julius and Lucinde in Schlegel's novel, the process of what Hegel calls *Verzeihung* is not that of ordinary "forgiveness" at all. In essence, we are dealing with a *logical* forgiveness, exchanged between the agent and the observer, for the inevitable one-sidedness of being agent and observer. Certainly the transformation of one's conscious point of view as it becomes logically "conceptual" (or rationally "comprehensive") has its moral application; and as I remarked earlier, it is more accurate to say, with Madame de Staël, that one becomes "very indulgent," than that one "pardons." For one knows that one is not in a position to pardon. "There, but for the grace of God, go I" is what one says at best; and often only, "I am glad it was not me who had to act." In these formulas one can see already that it is the need for moral judgment that is suspended.

This is the "essence" of the move to the level of a purely logical recognition that action and judgment are equally necessary moments of free self-conscious being; and that they are equally inadequate and partial taken in isolation. The "Heart" or the "Heart's Law," which Conscience recognized itself to be in its self-conscious possession of its absolute autonomy (as the Beautiful Soul), cannot be realized either in action or in judgment, but only in "comprehension." That is why the "word of forgiveness" is (in its logical sense) the foundation of absolute Spirit.

What emerges directly at this point, is not the logical community, the community of "pure" thought, but the religious community. Our religious community (and by that I mean Hegel's rationally enlightened "Lutheran" community which is now an invisible Church, deeply impregnated by hypocritical self-deception, but so widespread that its bounds are hard to find) is the community in which the ideal of "tout comprendre c'est tout pardonner" is almost universally preached, though more fitfully realized in actuality. The fact that our religious community is both intensely "moral," and that it does also resolve the problems of the Moral World-View, should not blind us to the important truth that the "forgiveness" of which Hegel speaks is not simply a moral category, and that the religious community is not primordially a moral community. Unless we grasp the fact that Religion is the phenomenally objective mode of the purely logical category of the Concept that comprehends both action and judgment universally, we shall never understand how Hegel can pass directly (as he does) from the appearance of the Holy Spirit, the moral comforter who is the Lutheran Savior visibly risen in his community, to the

worship of the Daylight in ancient Iran. Paragraph 671 closes the chapter properly by resolving the problems of the morally self-certain Spirit. But that is only a specific application of the logical reconciliation, the triumph of the ethico-historical point of view, and the elimination of all the attitudes of the moral valet. At the end of paragraph 670, the two sides of *one* self-consciousness (“pure knowledge as *universal* essence” and “pure knowledge as absolutely self-subsistent *singularity*”) recognize each other as the sides of one Self-Consciousness. The singular self who seeks (actively) to know the universal essence is the historian. We are establishing the standpoint of the philosophical historian: *Homo sum; humani nil a me alienum puto*.⁷⁶

- 40./671. Only at this extreme where its self-knowledge has these directly opposite alternating sides, does Spirit enter into being. The judging consciousness is the continuity of the (positive) universal; the agent is the exclusive singular unit. The uniting of the nonactual good and actual evil is in their *speech*. The two spirits are entirely self-concerned, but of course there is an absolute distinction between them, and they know it, for they are both self-conscious concepts. These two are the *species* of the self-concept, and each embraces the whole self. Their relationship is the ego in its self-identity. But this self-consciousness of their identity has still to come into being. At present only the continuum (of consciousness) exists. When the two say yes in reconciliation, God is manifested in his community of self-knowing beautiful souls.

In paragraph 671 the two “sides” of the Beautiful Soul are internalized and become moments of one self-consciousness. In order to do this they have to be purely conceptual moments. So the language is very abstract and difficult. It will be wisest to begin our commentary by examining the best paradigm of the “experience” that we can find. The ideal model is not hard to identify.

The conceptual reconciliation that is involved here will take us from the standpoint of moral judgment in its final shape to that of historical judgment proper.⁷⁷ But the “word of reconciliation” between the Beautiful Soul as moral action, and the Beautiful Soul as moral judgment, was the word spoken by the Beautiful Soul who experienced and overcame the antithesis (of action and judgment) universally (not just privately like Julius and Lucinde), and who never allowed the alternation of pure Being and Nothing (the state called “Yearning”) to arise.⁷⁸

Jesus of Nazareth went about proclaiming “Your sins *are* forgiven” quite impersonally, and as a simple statement of fact. It was the critics who brought God into it—“Who can forgive sins, save only God?” But we have watched “moral consciousness” discover that in fact “God” cannot forgive sins, unless either he ceases to be holy, or we cease to be autonomous (or both). So Jesus was in the right.⁷⁹

There was a paradox involved in the way Jesus spoke all the same. No one could understand him. Like the other geniuses, he was trampling the roots of humanity underfoot. This is the paradox that is now resolved. The Beautiful Soul has split into its two sides: the absolute knowledge of duty, which reduces to the Heart’s Law “that we must love one another”; and the absolute performance of my duty, of the act that is mine, which expresses my self-definition. Take, for instance, Peter’s decision that it would be foolhardy, having put his head into the lion’s mouth already, to

admit that he was a follower of this man Jesus (to call this a duty may seem strange but compare Hegel's example [par. 644] of the soldier who runs away).

The Hard Heart set itself up as the Universal Judge, condemning the whole world of conscientious agents. We must put it like that, because only properly conscientious agents can understand the Heart's judgment and join in it. But, of course, the range of the judgment once poor Peter is forgiven, and the aspect of singular self-will drops out, is much wider; Pontius Pilate, for example, must be "forgiven" for thinking that Roma is a goddess with positive authority over "consciences" like the one that faces him.

Only an active Conscience will acknowledge itself to be "evil" when it is so "known" and identified by the conscientious observer. Caiaphas, for instance, thinks it is Jesus who is "condemned out of his own mouth." That there is a standpoint from which the boot is on the other foot is quite beyond his horizon. But Jesus—like Socrates—stands beyond judgment. It is those who judge, who stand in danger of judgment. The community in which we are now operating is the one for which Luther spoke, not the one against which he took his stand. Jesus and Peter (and Socrates too) belong to this community.

The Beautiful Soul, with its direct knowledge of God as "its *pure* self," is the fully self-conscious *Gestalt* of this community of reconciliation. Jesus—the Johanne figure who said "I and the Father are One"—is the earliest clear case, and the most extreme case also. It is literally true, for him, that "the Father" is his "pure self" (not his "friend" to use the language of Goethe's model case); and it is "the Father" who forgives all those who "know not what they do."

In the Hard Heart, this identity with the Father is identity with the Judge—as Peter, the first to recognize the "identity with the Father," found to his cost when he took his sensibly self-preservative course among the spectators in the courtroom. This was not a moment like the little ceremony of confession and forgiveness before making love, which we are allowed to overhear in Schlegel's *Lucinde*. Here the two self-certain Spirits met head-on. But Jesus appears here as the Broken Heart, the *fixed* shape of the abstract "Good." We should notice that he is not now "evil," for he does not judge. He is only Peter's "pure knowledge." The moments have been inverted again by internalization. It is the agent self who is "evil." Peter condemns himself, and it is Peter who must gain the insight to forgive himself. It is important that Jesus does not speak. This is the moment of "pure knowledge posited through the antithesis as *consciousness*."

It is this internalized distinctness (*Verschiedenheit*) posited within self-consciousness (or "in the element of the pure Concept") that is now to be mediated. If we take Peter (who "went out and wept bitterly") as our model case, he is as clearly aware of the problem as we are. How is the "accuser within him" (to recall Kant's phrase) to be transformed into the "reconciling Yes," and the hand of fellowship?

The answer is through the exchange of roles. The Hard Heart judges its community. But when it "breaks" properly it must return to its membership in the community for its redemption; and Peter, who finds his accuser in the memory of a face, must turn likewise to the community who can remember that face. This is an

uttering of singular selfhood that generates the greater self (“the *continuity* and *equality* of the ‘I = I’”). The word of reconciliation exchanged between the singular sinner and the observing community who know that we are all sinners, is the “Holy Spirit”: it is not a remembered face, but speech, *logos*, the “thereness of Spirit.” And if we take the reconciliation in its logical sense, then the community generated is the “absolute” community of all human experience.

The crucial point, for the moral experience from which this “absolute” community takes its rise, is that one cannot (logically) “forgive oneself” in a rational sense. For Peter to cease weeping over his betrayal would only be a new betrayal. There must be another who says “Your sins are forgiven.” Thus the reconciling word is the “*being-there* of the Ego extended to the duality” of the singular agent conscience aware of God within it, and the observing community of other such selves. In the reconciling word, the God who is “within” all of them appears among them. His appearance is momentary. But in Hegel’s next chapter that momentary character will be developed into the perfect continuity of all human experience—from the dimly discernible Mother Goddess of the palaeolithic cave dwellers to Gandhi’s *Ahimsa* (which is the word of reconciliation itself raised into a religion) and beyond.

Hegel’s conception of the reconciled community resolves all the problems of the Moral World-View. It is the “harmony of duty and felicity”; it is the gracious power that recognizes the “good disposition”; and it is the “good infinite” in which the “infinite progress” is resolved. It is the reconciliation of “actual” and “imperfect” moral consciousness—the “evil” and the “good” which are the necessary moments of its “pure knowing.” It unites the concrete singularity of conscientious conviction with the abstract universality of moral observation in a truly concrete universality.⁸⁰

Let us now try to expound the paragraph as it is written: Absolute Spirit enters into *Dasein* at the peak-point where the “pure knowing” is the “antithesis and alternation” of knowing the universal essence as one’s own, and knowing oneself as the absolutely self-contained singularity. This *Dasein* has an *ideal* way of being” For instance, Peter *remembers* that moment and that face for many years. But the slave in Terence (vividly aware of his place at the bottom of the social heap) saying “I am a man; I count nothing *human alien*” is the perfect case. He knows that his “pure knowing” is the “abstract essence” and that “to count nothing human alien” is his *duty*. Yet as much as anyone (and more keenly than many socially sheltered folk) he knows “the *singularity* of the self to be the essence.” “Everything human” is the “pure continuity of the universal”; and that rational continuum knows the selfish singularity to be *evil*. But this strictly private self-consciousness (which must declare itself if it is there to be known at all) knows that the rational continuum is “not actual,” but is only *for another* (just as Peter knows that the face he remembers is long dead).

At this point Peter and the slave in Terence must become logicians. Their situation is the universal situation of human rationality. The encounter is between the two sides of their own selfhood. Peter sees his duty in that remembered face (and the Terentian slave must be aware of his own selfish frailty in his cheerfully universal utterance). These are the self-concepts that must unite in the speech of the

Absolute Spirit: the opposite “spirits” of pure self-assertion and pure altruism. The whole self—indeed, the whole range of selfhood and self-expression—is equally fulfilled by both of them. But “they are still diverse and the diversity is absolute” because the two sides are nothing but logically necessary moments. So they have only their conceptually determined roles. They are determinate in their opposite roles, but each is also “universal in itself.” Each side is the whole antithetic identity of pure knowing, so they know that in their opposite roles they constitute together the whole range of a single unified Self-Consciousness. Both sides are the same “pure self-knowing” and it is only the need of forgiveness that constitutes the one as the knowing of universal humanity, and the other as the knowing of “discrete singularity.” The self-identical ego which they aim to become, and know that they really are, is the “relationship and antithesis” of the universal and singular roles. When the two sides come together in the word of mutual recognition and agreement, humanity as the universal community and the singular self-assertive agent achieve the identity of absolute selfhood.⁸¹

If we consider the actual ego of the historian, we shall have a good *Vorstellung* of what the community of forgiveness both wants and is. But the emergence of the “perfectly inward” into *Dasein* as “consciousness” is exactly portrayed (as we already saw) by Peter’s experience when Jesus simply looks at him after the speech of betrayal. There is a perfect identity of “knowing,” but no “self-consciousness.” Self-consciousness is generated through the “motion of the antithesis.” Every self is *equally* the continuity of “everything human.” Each of us is the same contradiction between perfect continuity and radical discreteness. We must “pour out” (*enttäusern*) the contradictory knowledge. In being poured out, the secrecy of the discrete self is overcome, and the community of selfhood is positively established. The knowledge that is “split in two” in its immediate way of being (as sin and as forgiveness) “returns into the unity of the self” because it is not separate any more. The “yes” of reconciliation makes positive continuity and equality out of the negative equality of private secrecy. The self of the pure knowing now has *Dasein*. The two self-concepts are united in the self-knowledge of the finite self in God; and the reconciling “Word” is the Risen Christ to whose Body all who know him in themselves, and themselves in him, belong.

The worst difficulty in paragraph 671 is that posed by the internalization of the dialectic. The encounter between the *evil* awareness of singularity and the *good* consciousness of universality is purified into the recognized identity of two “pure Concepts” of the self. This makes the transition to Religion difficult because it takes us straight to the moment of transition between Religion and Absolute Knowing. The dialectic of the Religion chapter is all in *Vorstellungen*. But the *Vorstellungen* of Religion all refer to an absolutely “spiritual” experience (i.e. to one that is all in thought) above and beyond the finite world of sensible phenomena. We can recognize, if we will but try, that the “pure concepts” of Logic at the point of transition from Religion to Absolute Knowing are directly continuous with the absolute intuitions of God in religious *Vorstellungen* at the point where we have now arrived.

We have actually reached the positing of “pure knowledge” (i.e., Absolute Knowing) as *consciousness*. It is not yet the *self*-consciousness that it will become in Logic (even though there is no “selfless *Dasein*” in it). The connecting link is provided by the Beautiful Soul, with its aesthetic *Vorstellungen* for a spiritual world that is purely inward (except for its language). In the experience of forgiveness that inward experience becomes *real* (not imaginary). Peter stands between the memory of a real betrayal, and a real community that reconciles him in its spiritual unity with the Savior; the Terentian slave stands between the actual society that oppresses him, and the human community that he “recollects” imaginatively; and finally, the philosophical historian can “recollect” even the worship of the Daylight as a human phenomenon. But none of them are yet employing pure Concepts self-consciously.

The opposites (which are the actual poles of the self-aware human community) “know themselves as pure knowing”; and they are going to prove this in detail, by experiencing “everything human” in its absolute aspect. For the time being, the side of singular self-consciousness is drowned in the continuity of the universal self. This “absolute consciousness” is not yet singular self-consciousness. *We* shall now be its “historians.” What concerns Hegel (and us) at this moment is the fact that the founding of the self-forgiving community generates a new Concept. In place of Morality we now have Religion. As a “universal self” (the concretely reconciled consciousness of that enlightened, post-revolutionary community against which Hyperion turned his moral disappointment) the name of this concrete Concept is “the universal Church.” But if we are to uncover the full extension of the Concept, then the whole story of the “experience” of this universal self must be gone through. The human community has only become the concrete community of Conscience slowly, and over many stages. If we are to comprehend this new concept we must go through the whole “experience of consciousness” as the story of a universal human community whose object is not “the world” but “God.”⁸² The one thing to be thankful for is that since we have now reached Absolute Spirit (or the *Weltgeist*) as the observed subject of the experience, its interaction with its world can unfold in a straightforward historical order.⁸³

Notes

1. The letters U, P, S are used in the Analysis for the logical moments: Universal, Particular, Singular.

The evolution of Conscience in these three stages is illustrated by P. Muller (1988). M. N. Forster (forthcoming, Part III, Chapter 4) claims that the theme of the history of “Spirit” is distorted into a revision of “Reason.” I trust that my commentary will show that this thesis is quite mistaken. There is no repetition of Chapter V such as would make it really plausible; and I am certain that Forster’s underlying hypothesis that Chapter VI was added to the plan of the *Phenomenology* as a late afterthought is itself mistaken. For a good discussion of the place of Conscience in the *Philosophy of Right* (with helpful references to the literature in English and German) see D. O. Dahlstrom (1993).

2. We can see here how important it is that Sense-Certainty is the peasant-wife's knowledge of her own *Sachen*, not the awareness of such refined philosophical objects as "sense-data." D. J. Cook (1973, 93) rightly emphasizes that "Conscience" (*Gewissen*) is the union of Sense-Certainty with Self-Certainty.

3. See Nohl, 51 (Bern, 1794; Fuss and Dobbins, 82). Conscience is also a clear example of "rational action" as an immediate transition (pars. 401–404). But the first spirit to *realize* that was the Truth of Enlightenment.

4. See especially *System der Sittenlehre* (1798), sections 15–16, *Werke* IV, 163–205. (To the best of my knowledge it was E. Hirsch (1924) who first drew attention to Fichte as the *Gestalt* of "Conscience." His article is now reprinted in Fulda and Henrich [1973, 245–275]. But see also M. S. Gram [1978, 378–380] who repeats Hirsch's case with some embellishments. D. P. Jamros [1994, ch. III] discusses the whole of the Moral World-View as a critique of Kant. He sees the transition to Fichte as occurring only when we reach "Conscience." Compare also D. P. Jamros, 1990.)

5. *Werke* IV, 167; IV, 173–174.

6. *Social Contract*, Book II, Chapter 3. Rousseau is the connecting link between the negative certainty of the Terror and the positive certainty of "Conscience"—cf. also T. Pinkard (1994, 400, n. 158). It is clear that Fichte agrees that Conscience needs "enlightenment," for in the Second Part of the *System der Sittenlehre* (secs. 17–33) he gives us a "systematic overview of our duties" ending with the "duties of the lower classes." Hegel gives the immediate, unerring knowledge of Conscience, the solid social foundation that makes the superficial nature of this sort of review quite patent. But he does recognize that the established ethics can be conscientiously rejected. This is shown, for example, by F. Valentini (1971). For a detailed study of the relation between "ethical life" and "morality" as Hegel viewed them at this time—specifically in the "Philosophy of Spirit" of 1805/1806—see M. D'Abbiero (1975).

7. See *Bestimmung des Menschen* Book II, *Werke* II, 199–247, especially 202, 229–230, 241 (Chisholm, 35–82, especially 38, 65, 77); *Faith and Knowledge*, *G.W.* IV, 402–405 (Cerf and Harris, 174–178).

8. *Tat* and *handeln* are such ordinary words that one of them, at least, was bound to occur here. The combination *Tathandlung* is distinctively Fichtean; but it does not actually occur here.

9. See especially *Werke* IV, 156: "I should never act against my conviction . . . Act always according to your best conviction of your duty; or: Act according to your conscience"—and IV, 163: "The formal law of ethics goes thus: Act strictly according to your conviction of your duty." See further, among many other passages, the one cited at note 5 above.

10. Jacobi, *Werke* III, 37–38. Hegel quoted this passage in *Faith and Knowledge*, calling it "beautiful and quite pure" (*G.W.* IV, 380–381; Cerf and Harris, 143–144). I have quoted it from there also; and we shall have to return to Hegel's discussion later. G. Falke (1987) has maintained that Jacobi is the *Gestalt* in Hegel's mind for the whole section studied in this chapter. This claim was anticipated by O. Pöggeler (1956, 54) in a more modest form. See also V. Rühle (1989). I regard the claim as slightly overstated because in Jacobi's interpretation of the principle the direct *inversion* of Conscience into the Beautiful Soul is made explicit; while in Fichte's doctrine of the primacy of conviction this "antithesis" remains submerged in the harmony of the "resting Concept." "The law is for the sake of the self" only acknowledges that I must myself determine what law applies to my actual situation. (But see further note 74 below.)

11. See *Faust* Part I, lines 1224–1237 (the scene is not in the Fragment of 1790, so it would not have been known to Hegel in 1806).

12. Findlay (1958, 112–113) used the “disinterestedly frightful Nazi” as an illustration at the level of the “honorable consciousness” that is devoted to the *Sache selbst*. But at that stage the opposition of “self-interested and disinterested” has just been theoretically reconciled in the concept of “general utility.” That is why the dialectic of “humbug” can arise. Eichmann’s defence belongs properly to the level of “Conscience” (cf. par. 644 below). It provides the most graphic paradigm case for Hegel’s critique of Kantian “formalism.” But it is also fully “conscientious” because Eichmann took his stand on the *Sittlichkeit* of military obedience.

13. This is perhaps the best place to comment on the view of many orthodox Marxists that Hegel confuses “action” with the “thought of action” (cf. H. Lefebvre, 1962, 31). The point is that “talking” is an action; and while it is a “humbug” sometimes, it is also the most seriously consequential form of action at others. It is also the mode of activity where the *identity* of thought and action is most evident. Hegel does not *confuse* different things; he seeks to comprehend the opposite moments of one thing.

14. We can see here why the Kantian view has to be the fundamental position of the Moral World-Intuition. The ultimate necessity for “grace” (pardon, forgiveness) rests upon the radical uncertainty of our own self-knowledge (which Fichte tried to ignore both in his theory and in his practical life).

15. See chapter 8, note 44 above for the distinction involved here.

16. See *Toward the Sunlight*, 260; and my review of *Jakob Zwillings Nachlass* in the *Bulletin of the Hegel Society of Great Britain*, no. 13 (Spring-Summer, 1986).

17. I am simply assuming, for the sake of argument, that a respectable wine-merchant will be “moral” in a secular sense—and hence “conscientious,” rather than “religious” like the true denizens of the “Moral World-Order.”

18. Frau Gock certainly was a deeply religious woman; and perhaps she always thought of herself as seeking to do the will of God, rather than as acting upon her own conscience. But the account book which she kept of her administration of Hölderlin’s legacy is a model of conscientious responsibility.

19. His conversation with the Comte D’Argenson was recorded by Voltaire (in the “Discours préliminaire” to *Alzire*). See *Pilgrimage*, chapter 11, note 43.

20. The word *Betrug* sends us straight back to the world of the *Real Individuals*; and it is certainly no accident that Hegel has just told us that Conscience is the inversion of the “*Sache selbst*” from predicate into subject. (My own historical conscience obliges me to add that there is no evidence that Hegel actually regarded Johann Noé Gogel in this way; but there is good evidence that he viewed the patrician families of Bern in this light when he was house-tutor for one of them—see Letter 11, to Schelling, 16 April 1795, Hoffmeister I, 23; Butler and Seiler, 35).

21. Sartre was certainly mindful of Creon and Antigone, when he set up the case, in “Existentialism is a Humanism.” (M. Westphal [1978, 176–179] is right to call Conscience “anarchic.” Unity can only be restored, without regression, by moving on to the comprehending reconciliation of the *moral* religion.)

22. It is clear that some (Fichte?) polemic against the *Ermägung* and *Vergleichung* of duties is referred to here. But I have not managed to identify it. The other words italicized are “*Zufälligkeit der Einsicht*,” and “*Berechnen . . . abzuschneiden*.”

23. We must, of course, remember that only someone who claims “pure” insight (i.e. a rational insight that all can share) is asserting the right of “Conscience.” Thus Savonarola was a kind of proto-Lutheran in politics; but he was not a figure of “Conscience,” because he believed he was especially singled out by God, or that he had a *prophetic* “mission.” It is Romola who speaks for the rational conscience in the argument about her godfather; and Savonarola’s response is that of enlightened Utility, not that of moral rationality (*Romola*, chapter LIX; see above, Chapter 8, note 57). But Charlotte Corday can stand beside Timoleon in Jacobi’s list.

24. An insightful analysis of how Hegel shows that Conscience is inevitably convicted of evil is given by J. M. Bernstein (1994).

25. “The Battle of Blenheim,” last stanza.

26. This explains why most of us can belong to the community of forgiveness without any conscious passage through a “Beautiful Soul” stage. Also it explains why we do not (usually) arrive at the level of universal (historical) forgiveness. The “resting Concept” is sufficient unless life tries us unusually hard; or unless we become entangled in *philosophical* difficulties, because our theoretical interest is aroused.

27. See *Oedipus Coloneus*, lines 521–548.

28. In addition to the *Oedipus Coloneus* 521–548 see 960–1002; and *Antigone*, lines 921–980. Of course, Sophoclean Thebes is a long way from the Moral World-View. But the *objectifying* power of recognition is evident, for example, in the readiness of the sons to support the exiling of Oedipus against his will. Clearly, they felt that this would make recognition of their own claim to the kingship easier. Oedipus curses both of them (and especially Polyneices) for setting the world of public recognition above that of natural family obligations—see *Oedipus Coloneus*, lines 789–790, 1352–1392.

29. The reference to Luther at the Diet seems to be almost as plain as the reference to Fichte: selfhood is brought together with *Dasein*, by direct identification.

F. Schalow (1993, 173–180) has shown how this experience of communicative identity provides the occasion for a more sympathetic reading of Hegel in the perspective of Heidegger’s “question of being” than Heidegger himself offers.

30. Compare especially *Antigone*, lines 806–882; in the *Oedipus Coloneus* we begin with the Stranger commanding Oedipus to leave the grove of the Furies (36–37) and end with The-seus commanding Antigone and Ismene to go home without visiting their father’s burial place. “Lament” is, of course, the general content of this play.

31. See the passage cited at note 10 above.

32. F. Schlegel’s contributions, with all of his other fragments, and the novel *Lucinde*, have been translated by Peter Firchow (Minneapolis, U. of Minnesota, 1971).

33. Compare *G.W.* IV, 385–386, with 316, line 33–318, line 3 (Cerf and Harris, 150–152, 57–58); see also *Difference*, *G.W.* IV, 8, lines 4–13 (Harris and Cerf, 83).

34. For the Beautiful Soul in earlier literature see Hans Schmeer (1926). He has shown how the contemporary *Gestalt* emerged in the work of Wieland (H. Schmeer, 1926, 43, 71–73). But it became topical through Book VI of *Wilhelm Meisters Lehrjahre* and Jacobi’s *Woldemar*. For Hegel’s study of Jacobi compare *Toward the Sunlight*, 89. I have myself seen only the third (revised) edition of *Woldemar* (1796). This is the version reprinted in Jacobi’s *Werke*, volume V. The auction catalogue of Hegel’s library lists only volume 2 of the second edition (1794); but Bonsiepen and Heede refer to the edition of 1796 without comment.

35. B.C. Sax (1983) has given us an interesting comparative study of the significance of the Beautiful Soul in *Wilhelm Meister* and in the *Phenomenology*; but the reader should be warned not to accept his view that the following chapters are “the opening sections of a speculative logic” (462).

36. The new heroine is called in this allegory *Impudence*. But that name is only proper to her for this “fragment” of Schlegel’s vision. Speaking generally *Lucinde* portrays a “religion of love.” The encounters of [Jacobi’s?] Beautiful Soul with “Morality” and with “Impudence” are described as follows:

“I *do* have more feeling (*Gemüt*) than you do, my dear Morality (*Sittlichkeit*)!” said one. “But then my name happens to be Soul—in fact, Beautiful Soul.” Morality grew rather pale at this and seemed ready to break into tears. “But I was so virtuous yesterday,” she said, “and I’m always making progress in my efforts to be more so. I get enough reproaches from myself. Why do I have to listen to more from you?” Another girl, Modesty, was jealous of the girl who called herself Beautiful Soul and said, “I’m mad at you; you just want to use me.” . . .

. . . Now Impudence seemed less harsh to me. I could look at her boldly, and with astonishment had to admit to myself that her figure was tall and noble. She went rapidly toward the Beautiful Soul and seized her by the face. “That’s only a mask,” she said; “you’re not the Beautiful Soul, but at best Daintiness, and sometimes Coquetry as well.” Then she turned to Wit with these words: “If you’re the maker of those who are now called Novels, then you might have spent your time more profitably. In the best of them I can hardly find any trace of the inspired poetry of fleeting life. But where has the daring Music of hearts maddened with Love fled to—she who moves everything along with her, so that even the rocks themselves dance? No one is so foolish and so prosaic that he doesn’t babble about Love; but whoever still knows her doesn’t have enough heart and faith to speak her name.” (Schlegel, *Werke* II, 22–23; Firchow, 55, 56).

37. Schiller, *Werke* (National Edition) 20, especially 287. The whole essay is relevant, but Hyppolite (1974, 513) rightly drew attention to one passage; and D. O. Dahlstrom (1991) has spoken up for Schiller.

38. Friedrich Schlegel’s logic is the logic of subjective *fragmentariness*, which means that it is subtle and dialectical. Properly understood, it often leads in quite the opposite direction from that in which someone who tries to make the “fragment” into a whole of its own kind will be inclined to go. Thus Firchow (whose introduction to *Lucinde* is outstandingly insightful) quite correctly interprets the “religion” of Julius and Lucinde as depending on the assumption that the male role is active and the female passive (and he remarks that this was generally taken for granted by Schlegel’s contemporaries). It would seem, therefore, that two women cannot have the relation that Schlegel calls “friendship.” But, on the one hand, Firchow himself notes (25) that the “Dithyrambic Fantasy” depends on the *reversal* of these supposedly normal sexual roles; and on the other hand, “activity” and “passivity” (including the active imaginative capacity to invert their normal shapes) clearly depend on which partner is the “genius.” Schlegel does not stupidly assume that there is any rule about that. He can only show us how things are for the *male* “genius”; but it is quite clear that his imagination is “fragmentary.” The same “religion of love” which becomes the ideal of “friendship” in the work of “great Plato” will have a different shape altogether in the vision of a female genius like “holy Sappho” (Firchow, 63).

39. Goethe's Beautiful Soul does not live in a group of friends who are forever congratulating one another on their "beauty." So her piety can only be brought under Hegel's strictures if we allow that her "modesty" can be regarded as a "mask" that deserves to be torn off. This is plainly not Goethe's own view, or that of the characters in *Wilhelm Meister* who read her story. But since Hegel can hardly expect us to ignore her, he must be held to agree with Friedrich Schlegel in some sense. (His whole view of the moral genius is ironic—compare Preface, paragraph and *Aesthetics* (*T.W.-A.* 13, 93–97; Knox I, 65–67.) Her story must be studied as a whole; but her "modest" picture of herself (which is what justifies Goethe's bestowing on her a title which *she* would not think of using) is brief enough to quote here:

That I am always advancing, never going backwards; that my actions are always becoming more like the idea which I have formed of perfection; that I feel every day more facility in doing what I hold to be right, in spite of the weakness of my body, which precludes me from many services. Can all this be explained from human nature, into the corruption of which I have seen so deeply? For me, now, not at all.

I scarcely remember a commandment; nothing appears to me under the aspect of law. It is an impulse (*Trieb*) that guides and leads me always aright; I follow my feelings (*Gesinnungen*) in freedom, and know as little of restraint as of repentance. Thank God, I know to whom I am indebted for this happiness, and that I can only think of these privileges with humility. For I shall never get into the danger of being proud of what I could and of my abilities, as I have so clearly learned what a monster can be produced and nurtured in every human bosom if a higher power does not watch over us. (Goethe, *Werke* X, 439–440; trans. R. O. Moon, London, Foulis, 1947, 359–360.)

40. It is almost certainly the last pages of *Heinrich von Ofterdingen* that Hegel himself has in mind as the *Gestalt* of the Beautiful Soul "intuiting its own divinity." The transition to a new shape of "Conscience" (as Novalis himself calls it) is there very plain. But, for the relevance of the critique to the piety of Schleiermacher (which is outwardly more orthodox) see *Faith and Knowledge*, *G.W.* IV, 385–386 (Cerf and Harris, 150–152).

41. The difference between the religious "moralism" of the Beautiful Soul and Schlegel's aesthetic "immoralism" can be focussed clearly by considering the relation between intellectual and carnal love. Jacobi claims in *Woldemar* that a man must not sleep with the woman whom he loves in the spirit—that "true" love is quite distinct from lust. *Lucinde* is a tract against this separation of "sacred" from "profane" love—that is why Impudence tries to tear the face off of Beautiful Soul in Schlegel's allegory. (Hegel agrees, I think, that the religious "moralists" are more deeply immoral than the aesthetic "immoralists." But Schlegel's conscious return to the Earthly Paradise in the age of "innocence" is just as much an evasion of the rational destiny of humanity as Schleiermacher's attempt to make the Heavenly Paradise into a present experience.)

42. *Verborgen* is emphasized—and then repeated twice later without emphasis. The echo is probably from Jacobi's *Woldemar* (cf. G. Falke, 1987, 138).

43. In this connection the interpretation of the Incarnation given in the "Confessions" of Goethe's Beautiful Soul is particularly interesting:

"If we are able to think it possible," he [the Uncle] once said, "that the Creator of the world Himself assumed the form of His creature, and in that manner lived for a time in the world, so must this Being appear to us of infinite perfection, because the

Creator was able to unite Himself so intimately with it. Therefore, in our idea of man there should be no contradiction with our idea of the godhead, and if we often feel a certain unlikeness and remoteness from it, it is all the more on that account our duty, not, like the *Advocatus Diaboli*, to keep our eyes on the nakedness and weakness of our nature, but rather to seek out all the perfections by which our claims to similarity with the godhead may be made good."

I smiled and replied: "Do not make me ashamed, dear Uncle, by your kindness in speaking after my language." (Goethe, *Werke* X, 423; Moon, 1947, 346).

Christ, we should notice, is a *model* not a *mediator*. When "Uncle" restates the doctrine in "his own peculiar language" he offers *two* ideals; Goethe's own *aesthetic* ideal of a harmony of *all* aspects of human nature, and the Christlike ideal of the Beautiful Soul which sacrifices the lower nature for the sake of the perfect harmony of the higher nature. Both of them are achieved by simple creative genius without the mediation of another self. The Beautiful Soul is just our own true "self" which we have to get in touch with so to speak; or as "Uncle" puts it: "this creative force which can create what ought to be, and does not let us rest until either outside us or in ourselves, one way or the other, we have set it forth" (Goethe, *Werke* X, 424; Moon, 347).

44. This is, of course, an extreme simplification of what made the Nazi gospel attractive; and it involves a very one-sided isolation of the "evil" involved. But I think it is an accurate characterization of the absolutely subjective side of the autarchic consciousness that sealed itself off. (See, for example, Modris Ecksteins, *Rites of Spring*, 314–315.)

45. *System der Sittenlehre*, section 3; *Werke* IV, 47.

46. Goethe, *Werke* X, 439; Moon, 359 (see note 40 above). This confidence is one aspect of the picture that throws doubt on the "modesty" of this soul. If she is conscious of moral *motion* at all, one feels that it ought to be both up *and* down. (The soul that is properly "beautiful" does not have this *progressive* consciousness. It is *at the goal*, and talks about the experience of the goal. If it talks about itself at all, it must say what John makes Jesus say: "I and the Father are one.")

47. Schlegel, *Werke* (Berlin, Aufbau Verlag, 1980), II, 81–82 (Firchow, 113).

48. This is as good an empirical model of a phenomenological "progress" as we could ask for. But it is a progress *in religion*, and certainly a regress as far as moral autonomy and rational individuality is concerned. If the conversion had taken place earlier than 1808 we should have found some reference to it either here or in the Preface. Hegel made sarcastic references to it in later years. See, for instance, the *History of Philosophy*, *T.W.-A.* XX, 418 (Haldane and Simson, III, 507–508); and *Philosophy of Right* (1822) section 141Z (Ilting, III, 475).

49. *Faith and Knowledge*, *G.W.* IV, 386; Cerf and Harris, 151.

50. E. Hirsch thought so (1924, in Fulda and Henrich, eds., 1973, 256). He refers us to the following passage:

I considered men, as I had felt them and known them from my early youth, men of the most various upbringing, and everywhere I found but false notes, muffled or strident; only in the simple confines of the child did I find pure melodies—"It is better," I said to myself, "To become as the bee and build one's house in innocence, than to rule with the masters of the world and howl with them as with wolves, than to dominate peoples and soil one's hands with that unclean material." I wanted to go back to Tina and live for my gardens and fields. (*G.S.A.* III, 37–38; Trask, Signet, 50).

It is interesting to note that Hegel himself may have been the one who first likened involvement in political action to “howling with the wolves”—see his letter 22 (to Nanette Endel) of 9 February 1797 (*Briefe* I, 49; Butler and Seiler, 57). But even if this echoes conversations with Nanette before Hegel went to Frankfurt (as I believe it does), it could still stem originally from Hölderlin’s “hard-hearted” attitude towards the active life (expressed either at Tübingen or in subsequent letters). Hölderlin liked to compare the uncultured philistines with “wolves”—see the quotation in note 53 below.

51. Again the first to identify him was Hirsch (and this time his bad habit of identifying the character with the author does no harm, because Novalis died before he got beyond Heinrich, and Hegel clearly identifies him in the *History of Philosophy* lectures as the soul (referred to here) that “flickers out within itself and vanishes consumed [*schwindet*, the first, covert, reference to the *Schwindtsucht* that killed Novalis] like a shapeless mist that dissolves into air.” (See *T.W.-A.* XX, 417; Haldane and Simson, III, 510.)

Hirsch is right in saying that here again Hegel’s language comes from *Hyperion*, and is meant to recall it. Hegel wants to associate Novalis, as the absolutely pure soul who disappears into nothing, with Hyperion as the absolutely hard heart who condemns everything. Even in the *History of Philosophy* lectures—where Hölderlin is not mentioned by name at all—“subjective extravagance” is coupled with “madness,” just as consumption is coupled with madness in paragraph 668 here.

52. In his *Confidential Letters about Lucinde* (1800). Hegel brought this up in his Berlin lectures twenty years later with the obvious intention of causing embarrassment. See *The Philosophy of Right* section 164Z.

53. See the climax of the portrait (which is quoted in note 38 above). Hölderlin may have Goethe’s “Beautiful Soul” in mind when he speaks of “becoming as the bee, and building one’s house in innocence.” Hyperion has, as yet, no Diotima with whom to recreate the family life of the Garden of Eden. He is like Adam before Eve arrived. His task—in the “hard-heartedness” that is foreshadowed here, though it comes to full fruition only after the *loss* of Diotima—is to *name* all the “animals” in his “spiritual kingdom.” Hirsch was again the one who recognized where Hegel’s “*geistige Tierreich*” comes from—see *G.S.A.* III, 22 (Trask, Signet, 35–36). But he did not grasp the significance that Hegel saw in the “hard-hearted” attitude that Hyperion evinces even on his first arrival in the “world of culture”:

As I went now here, now there among these cultured people, it seemed to me that human nature had resolved itself into the multifarious species of the animal kingdom. As everywhere, so here, too, the men were especially demoralized and corrupted.

Some animals howl when they hear music. But my more mannerly humans laughed when the conversation turned to beauty of spirit and virtue of heart. Wolves run away when you strike a light. When these men saw a spark of reason, they turned their backs like thieves.

If ever I happened to say a warm word for ancient Greece, they yawned and let it be known that after all a man had to live in this day and age; and—someone else added sententiously—good taste had not perished from the earth.

54. Hegel is not interested in “Hell.” But he signalizes the return of the “singular self” to the Underworld of natural death when he speaks of the “still flowing together of the pithless essentialities of the evaporated life” (par. 659). The Beautiful Soul flies away to Heaven (the Air). But it is identical with the “pithless shade” of Polyneices (par. 474).

55. I am not sure whether this appeared in time for Hegel to have it in mind also. But Fichte's exposition of "love" is another clear example of a religious "happiness" that is really an unsatisfied *Sehnsucht*—i.e. it is really "unhappiness." (Hegel certainly got hold of this book quickly; there seems to be a definite reference to it in the Preface—cf. the commentary on paragraph 23 in *The Pilgrimage of Reason*).

56. Even Julius says "Only in *Sehnsucht* do we find peace" (Schlegel, *Werke* II, 94–95; Firchow, 126).

57. The dialectical pattern is exactly that of the *Sache selbst* (pars. 404–418). But it is used twice. The first time my *Sache selbst* (being in fact my *Selbst*) was quite unaffected. This time the dialectic works. The reason for that is what we have to comprehend. Why does the fact that I now *know* that my *Sache selbst* is literally my *Selbst* make such a difference? (The repetition is analogous with the unfolding of the positions of "moral consciousness" before its actual "shifting" begins; but there is no comparable repetition of a cycle of movement.)

58. Goethe, *Werke* X, 438–439; Moon, 358–359.

59. See above, chapter 8, 456 at note 52.

60. Completely unintellectual as she is, Mrs. Bulstrode would certainly accept every self-justifying rationalization that Bulstrode is able to offer to himself. She forgives his very silence, and she does so silently. Bulstrode cannot bring himself to admit that forgiveness is necessary. He accepts only her sympathy with his suffering (compare the discussion in the commentary on par. 624 above).

61. Goethe, *Werke* X, 424, 439; Moon, 347, 359. Hirsch was wrong to take *Lucinde* as the *Gestalt* of the Beautiful Conscience that confesses itself to be *evil*. For *Lucinde* pictures the complete concept of the Beautiful Soul (which already contains implicitly the "antithesis" of Evil and its resolution in "forgiveness"). Compare the section "Fidelity and Playfulness" (*Werke* II, 36–43; Firchow, 68–76) which is the only place that the word *böse* occurs. The proper *Gestalt* of "*das Böse*" as the *developed* (explicit, *für sich*) antithesis is the "Hard Heart"—i.e. Hyperion as the "Hermit in Greece."

62. The *Oxford Book of Quotations* traces it to Mme Cornuel (1605–1694), quoted in the *Lettres de Mlle Aissé*, Paris, 1787, xiii (13.viii.1728). It was Voltaire who edited and published Mlle Aissé's letters. This helps to explain how the aphorism achieved such a wide currency. J. D'Hondt (1985) has provided us with a lot more of the background of this "proverb." Hegel himself would have found it most easily in Rousseau's *La Nouvelle Héloïse* Book IV, Letter X. (A. W. Wood gives some other relevant references in his note 3 to sec. 124 of the *Philosophy of Right*.)

63. The crucial point is that because both parties are asserting "Laws of the Heart," both are "particular" and must confess it. The "forgiveness of evil" is in no sense a legal matter. This is well brought out by A. Wildt (1982, 365–370). M. Westphal's claim that Hegel has "two ideas of Freedom" which are not the same probably stems from confusion about this. It goes back (at least) to his essay of 1972, and remains significant in his book (1979). He misunderstands the transition in this part of the *Phenomenology*, and does not grasp the relation of State (or politics) and Church (or morality) correctly.

64. *G.S.A.* III, 156 (Trask, Signet, 166–167). The fact that Hyperion's letters are addressed to Bellarmine, the "beautiful Hermann" of some future Germany, shows the sublated presence of the yearning hope of the Beautiful Soul in its "harmonious" form.

65. See for instance the passage quoted in note 53 above.

66. See *T.W.-A.* I, 346–355; Knox, 232–240 (and *Toward the Sunlight*, 352–356, 366–375). The difference between Hegel’s discussion at Frankfurt and the discussion here is well brought out by L. Lugarini (1986, 187–212). D. P. Jamros (1990) has surveyed several views (Hirsch, Kojève, Solomon) of the figure of forgiveness. He does not attend to the problem of Hegel’s audience, but he draws the right philosophical conclusion.

67. It is also a sin against the Categorical Imperative (cf. O. O’Neill, 1975, 76–79).

68. Just as there is (but in a different way) between being a Beautiful Soul and becoming a Catholic convert (in the case of F. Schlegel).

69. *T.W.-A.* XX, 418 (Haldane and Simson, III, 510. Miss Simson translated Hegel’s deceitful *häufig* as “constantly”; so the deceit has hidden the true meaning completely).

70. I put it as strongly as this because I am sure that Hegel believed (as I do) that it was actually the fear of prosecution for treason that destroyed the last vestiges of Hölderlin’s hold on reality. Like Hyperion, though with much less Romantic *éclat*, Hölderlin *lived* his ideal as well as he could.

71. Hölderlin, *Lebensdokument* 520a, 6 March 1830—*G.S.A.* VII, 3, 119. This is from the private diary of the Princess, but she also wrote to her brother and two sisters about the experience. Anyone who thinks that the stiff and clumsy Rector Magnificus may have been only an external stimulus for this obviously unexpected and impressive experience should study further how Hegel’s merely *mechanical* memory worked to aid Lieutenant Diest in 1821 (*L.D.* 416, *G.S.A.* VII, 2, 471); also his obviously better than mechanical memories of the Empedocles project, and his critical opinion about the Sophocles translation (*L.D.* 451, *G.S.A.* VII, 2, 544).

72. He believed, similarly, that there was a connection between *Spinoza’s* life and character as a “beautiful soul” and his death from consumption.

73. Thesis X, *Erste Druckschriften* (ed. Lasson), 405; Waszek (in D. Lamb, ed. 1987), 254.

74. I learned the saying as a sort of moral proverb. But it is, apparently, a misquotation of Mme de Staël’s *Corinne* (1807), Book IV, chapter 2: “Tout comprendre rend très indulgent.”

The essay of G. di Giovanni (1994) made me see that Jacobi is the *complete* figure of “Conscience.” Compare the following passages from Jacobi’s *Woldemar*:

“Dear Henriette,” [Woldemar] said, “no word can say how I feel! Loudly could I and *would* I confess before the whole world that I am the guiltiest among all men . . .” (461, *Werke* edition).

. . . “I will learn humility,” he said. “You bring me back to myself! What in me now [lies] so dead against my own self . . . That too is pride! always the same hard, unbending, pride . . . I was not good, Henriette! But I shall *become* it. I will learn *humility*; I will be *yours* . . . Oh, do *accept me*! (476).

But I do not regret my efforts to distribute the different moments to other writers and their works—not only because Hegel himself makes some other references, but because it is important for us to understand that the “experiences” to which he refers were culturally widespread.

75. See Hölderlin, *Lebensdokument* 616 (Ruge to Marx, March 1843). The reception is of course marred (from Hegel’s point of view and Hölderlin’s) by the carrying-over of the *divisive* aspect of the judgment. Ruge (and the proletariat) could adopt Hyperion’s attitude to the bourgeoisie, and see themselves directly as Bellarmin (the Germany of the future). But

Hyperion did not want to be the prophet of the class-war; he knew already where *that* vocation leads.

Both P. Laska (1974) and H.E.M. Hoffmeister (1974) complain that Hegel's theory of "situated freedom" does not guarantee reconciliation with the economic (or the political) structure of one's society. But it is not the task of philosophy to solve the world's real problems. We can only observe how things are, and why we must be "reconciled" to the situation, if our actions are to be morally effective. (Hoffmeister is right in claiming that any innovative moral act involves "faith." But the *Hegelian* "beyond" is only that of the historical future, and of the "cunning of Reason." The conceptual problem is clarified by G. Planty-Bonjour [1983, 24–28].)

76. "I am a man, I count nothing human alien to me" (Terence, *Heauton Timorumenos*, 77). W. Desmond (1992, 161–162) says that Hegel inverts the proverb and reads "To forgive all is to understand all." This is too simple. One must suspend moral judgment in order to achieve understanding; and sometimes (but surely not always?) understanding results in actual forgiveness. Hegelian forgiveness is self-recognition in the other. Desmond's problem about the ambiguous identity or duality of the Spirit is a verbal confusion only. It is a matter of definition that Spirit is identical; and a matter of logic that it must dualize itself in order to exist as the identity of communication that it is. For the rest, there cannot even be two *things* that are "radically *other*"; even the thing-world is a community. (W. Desmond [1992] is a shortened version of [1992a, chapter 4]).

I agree with M. A. Bertman's comments that "Hegel's claim to wisdom . . . is grounded by emancipation of the divine from Platonic dualism" and "the question of personal corruption is an intellectually retrograde illusion" (1988, 179). But I do not understand his attitude to Hegel's historical dialectic.

77. Even P. Fuss and J. Dobbins (1981, 150) do not express Hegel's doctrine quite as clearly as the Terentian slave. Henry Adams offered what we may call Young Rameau's view of this transition. He says that "past history is only a value in relation to the future, and this value is wholly one of convenience" (1973, 488). He makes Hegel (who believes that true history is possible) into the quintessential Beautiful Soul: "a Hegelian is one who agrees that everybody is right, and who acts as if everybody but himself were wrong" (1938, 246). See further J. G. Kronick (1986).

Marcuse (1954, 115) says "The *Phenomenology* unfolds the structure of reason as the structure of domination—and as the overcoming of domination." He gives full value to the moment of healing and reconciliation at this point in Hegel's text, but he regards the transition to Absolute Knowing as the achievement of classical noetic "freedom" only. But Hegel thought of his philosophy as the exposition of modern individual freedom; and when we come to see that the reconciliatory task of "absolute knowing" vis à vis religious ideologies (to use Marcuse's own preferred terminology) is in principle a "bad infinite" (or endless) one, we can grasp the crucially important fact that Hegel's "absolute knowing" is as much practical as it is theoretical. So it is right to claim that the *Phenomenology* unfolds the structure of *liberation* rather than of domination. (It does, of course, also show us why we can never have a world without domination.)

78. C. Hamlin (1985, 160–162) is logically correct in reading paragraph 671 as the climax of a modern "tragedy," because it is the "return" of the harmony of "True Spirit." But it is Dante's *Comedy* brought to earth.

R. Bernasconi (1986, 335–344) has shown how these final paragraphs answer many of the criticisms that E. Levinas makes against Hegel. (He points out the importance of the moment of forgiveness as the transition to Absolute Knowing [par. 796].)

79. H. M. Ravven (1986, 57) is right to distinguish between “reconciliation” and “sin-cleansing.” Since “nothing in Fate is changed,” we cannot be “cleansed.” We “purify our hearts” (even in the Unhappy Consciousness) by putting the past behind us and making a new beginning. *Philosophical* purification—the topic of the whole “Science”—is a matter of adopting a new Concept that is more comprehensive. Thus the practical experience of “forgiveness” enables us to comprehend theoretically the whole range of ways in which the community is reconciled with itself and its members. “Sin-cleansing” (in many shapes) is an important ritual in this process. It falls into place at Eleusis. But more than a ritual it can never be. It is logically absurd (i.e. superstitious) to pretend that “God can change the past”; and it is morally wrong to pretend that I cannot always begin again, when I am ready to try. How the community can help me to do that is a contingent empirical problem—though we may find ways of improving our communal capacity, by maintaining our speculative observer’s attitude towards the many rituals that experience presents.

J. H. Shklar (1976, 199–202) understands the social reconciliation of agent and observer very well, but she does not recognize its religious foundation; and when she says (203) that “the *Phenomenology* might well have ended here” she shows that she does not care just how the social substance became a subject. That is just what Hegel cares most about.

80. Donald Stoll (1989, 106) complains that Hegel’s science is not adequate for existential crises. But “Science” does not deal with “crises.” It only tells us what (if anything) is adequate to deal with them; and if it is a logical “Science,” it will only be telling us what we must know already if we are intelligent enough to be students of it. At a more mundane level R. J. Eldridge (1989, 177–180) applies the doctrine of this paragraph to the reconciliation of Elizabeth Bennett and Mr. Darcy (in *Pride and Prejudice*). This should probably be regarded as a case of the “Concept at rest” because the forgiveness comes at once when the situation is clarified. (A. Cutrofello [1995, 3–12] has brought out the logical evolution of the concept of *confession* very well from the reconciliation of the Unhappy Consciousness to this point.)

J. Heinrichs (see 1974, 399) is one interpreter who has understood the “community of forgiveness” rightly. But S. Rosen’s way of expounding it (1974, 232–233) is quite misguided because “the transcendental or absolute significance of our individuality” is to be *more* than individual, not to be logically “windowless,” but to be members of the absolute human community; and that is what becomes possible through the forward move into Religion.

81. The necessity for forgiveness, arises from the recognition that all active freedom is finite. Forgiving is the only absolutely (i.e., philosophically) free act that we can perform; and forgiveness is metaphysically necessary for every action except that of being a philosopher in the Hegelian way (cf. *The Pilgrimage of Reason*, chapter 2, note 84). On any other interpretation of Hegel’s argument difficulties like those raised by S. Rosen (1980) will arise.

82. G. Lukács (1976, 504–505) calls the transition to Religion “wholly Utopian.” But since what happens is the *forgiving of imperfection*, it is the other catchword about “the opium of the people” that is properly in place. Some strange interpretations have been offered by students who took note of the parallel movement of Hegel’s “Religion” chapter. Thus J. van der Meulen (1958, 291) sees it as an “antithesis” to the preceding evolution of “Spirit.” That is certainly not the appropriate logical relation to invoke here. W. van Dooren (1969) understands the parallel correctly; and he argues rightly that the topic is not “God,” but “Religion.” But he goes too far, I think, when he claims to find here “not just the death of God but the end of Religion” (1969, 101). P. Kobben (1984/1985) examines Chapter VII from a Marxist point of view as the development of Hegel’s “ideology.” He sets up a pattern of interesting (though not always convincing) parallels between Chapter VII and Chapters I–V.

83. If we think of the process we have observed as the dialectic of the “subjective” or “formal” Conscience we can see how the transition from Conscience to (modern) *Sittlichkeit* has to be interpreted in the *Philosophy of Right*. The right line of interpretation can be found in L. Siep (1982), K. Bal (1987) and D. O. Dahlstrom (1993).

Chapter 10

The Divine Substance

VII: Religion

At the beginning of Hegel's seventh chapter our standpoint undergoes the most radical of all the transformations that occur in the Phenomenology. Already in the introduction to his sixth chapter Hegel has told us that the Gestalten of Spirit proper are "not just shapes of consciousness, but shapes of a world" (par. 441). When we reached the Moral World-View, the world of Spirit became an "inner" world—a transcendental realm, for which the actual world of Culture and Enlightenment exists only as an instrumental moment. But in Conscience that world is narrowed down to the subjective certainty of the agent's own decision; and the ordinary world becomes merely phenomenal. Only the absolute selfhood of a socially situated but "universal" (i.e., noumenal) subject remains as our object. For the Beautiful Soul, the universality of this absolute selfhood is the "God Within." The spiritual world is just a verbal creation—the magical echo of the poet's own voice in Novalis, and the dream-memory of a lost paradise in Hölderlin's Hyperion. The ordinary world is rejected by the "Hard Heart" as a hypocritical façade.

What happens when the Hard Heart breaks, and we make the transition to Religion proper is that the God within is projected outwards. God becomes recognizable as the spirit of the actual community in which we live and move. We give up the moral standpoint altogether, because we recognize the onesided inadequacy of moral judgment, and the universal necessity of forgiveness for our finitude. Forgiveness is recognized as the only moral duty that can be absolutely fulfilled. Whether as moral agents, or as moral critics we need forgiveness; and we can receive it only if we give it, for that is the only way to deserve it and so to be able to forgive ourselves. The soul that flies from the world to the God within, is guilty for that flight, and doubly guilty when it pretends to condemn the world in the name of the God within. This inner God must appear; he must become "manifest." That was already the fundamental imperative of the Moral World-View. But God can only be manifest as the spirit of universal forgiveness, the spirit that transcends the whole moral standpoint.

This transcending of the moral standpoint does not constitute a "moral holiday," as William James thought.¹ On the contrary, it is the climax of moral judgment, the Last Judgment that resolves all the problems of the Moral World-View. Not even God—so this Last Judgment says—can judge the world "justly," or be gracious to us "according to our deserts." He must have mercy equally upon us all.² But this "mercy" of forgiveness

is something with which (even for the religious consciousness that sees it as coming from a transcendent source) we must collaborate. God cannot forgive us, unless we can forgive ourselves; and to be able to do that we must both forgive others, and have the conscientious consciousness of commitment to the doing of our duty as best we can. For the absolute Self that is now manifest to us as an Absolute Subject "proceeding between" the finite and imperfect moral self and its universal community is that same being that first appeared to Antigone as the ineluctable "unwritten law" of family piety which has no known origin (par. 437).

The Spirit does not cease to be an "object" just because it has now appeared as a subject. For it is Substance just as much as it is Subject. The moral authority of Conscience is not affected by the recognition that the deliverance of Conscience is always one-sided, and hence in conflict with others. But the last law of Conscience, the one through which all consciences are reconciled, is: "Judge not, that ye be not judged." William James can with good right be committed to making the world better; and he can properly condemn those who are not (in his eyes) committed to that. But as a philosopher he must not presume to condemn anyone; for when he does that he falls short of his scientific goal, which is to comprehend them.

For us now the practical dimension of the transition from morality to religion is not what is important. As scientific observers of the experience of consciousness we have seen that the transition to "Religion" is the establishment of a universal world-historical observational standpoint that is very close to our own. It makes the theoretical (or "scientific") standpoint truly possible for the first time. It is only when we abandon the stance of moral judgment, only when we do not seek to be moral valets, that we can be scientific observers at all. Even William James, the dedicated, and justly celebrated, master of introspective psychology, would readily grant that the scientific observer of "bad" behavior must overlook its moral "badness" while he is seeking to understand its psychological genesis. A criminal already condemned, may be referred to the Jamesian psychologist for a report before sentencing; but it belongs to the very concept of an objective report upon her state, that she is not "judged" by the psychologist. The reporter must "forgive" everything in the effort to understand the truth objectively.

Thus we can now see that "the Absolute" has indeed been "with us from the start" (par. 73). For it is only in this spirit of universal forgiveness, universal "absolution," that we can be scientific observers at all. Hegel is about to demand from his readers an extension of that spirit of absolution, which some of them must have found conscientiously difficult in 1807. He will ask them to regard the obliteration of selfhood in the worship of the daylight, and still worse, the aggressive behavior of the Philistines who worshipped the great fish Dagon—together with the dog, ape and cat gods of the Egyptian "house of bondage"—as moments in the truth of "Religion."

We find this much easier, of course, than some of Hegel's contemporaries. That is partly because it is easy to be tolerant of what is dead and gone; but it is mainly because we have very little living religion left. Religion has become for us a matter of formal professions and ceremonial actions; and even in that aspect it was far more important (and more universally practiced) in Hegel's time. But that is only the "abstract" moment of what Hegel is talking about. Burial is a religious ceremony, and one that is

*still important in the eyes of many of us. But no one in our society would die to see it done; and a political authority that forbade it upon pain of death, would seem to most of us crazy rather than tyrannically oppressive.*³

It is wise to linger over the Hegelian Concept of Religion until the spirit of academic "absolution" does not come quite so easily. Kierkegaard chose for this purpose, to meditate upon the sacrifice of Isaac. But that is still a cheat, because in the end "the ethical" is reinstated, and the story concludes in reconciliation with God. Hegel would have us meditate upon a different case, more extreme in its violation of all reason, and without any final triumph of mercy. He makes this demand plain when he says that "truth is the Bacchantic revel in which there is no member who is not drunk" (par. 47). For as soon as we ask what Hegel knew about the "bacchantische Taumel," and what it meant to him, there is one source, and one source only, that forces itself upon our attention: the Bacchae of Euripides. What happens in that play is that after Agave, his own mother, the most sober and respectable dowager in the community, has given herself up to the new cult, King Pentheus endeavours to put a stop to it; and Agave comes out of her trance of Bacchic enthusiasm to find herself holding the severed head of her own son. Pentheus is no Creon; he is not a political fool, opposed to all innovation, especially on the part of the womenfolk. He is a good king, a true son of Apollo, a rational man who knows that mortals must respect the ethical boundaries of their existence. But when Hegel comments that "every member, as soon as it is sundered [from the revel] is just as immediately dissolved" it is this member, the ethical voice of "true spirit," who is pointed at by his literary source. The tragedy of "Religion" in Euripides goes as far beyond the tragedy of "True Spirit" in Sophocles, as the Sophoclean tragedy in its turn went beyond the Cartesian and Kantian comedy of Reason.

When we move from the standpoint of Morality to that of Religion, the consciousness that we are observing moves from the awareness of itself as finite to the awareness of the "other" self that is infinite. As Conscience (whether agent or critic) the finite self was striving to be infinite. The chapter on "Spirit" began with the immediate identification of the finite consciousness, with an absolute Law that it does not create, generate or legislate for itself, but which is, on the contrary, given to it in the natural bonds of its organic mortality. The giver of that Law of "True Spirit" is Zeus, the seemingly almighty Lord of life and death. But his infinite power is an illusion, and his finite community passes away.

In the truly infinite community of Reason which eventually takes the place of that finite community, the Lawgiver is recognized as the immanent might of Reason itself. But finally the contradiction between the finiteness of the actual spirit and the infinity of the Absolute Spirit, becomes explicit in the conscious experience of the rational agent and the rational judge. That contradiction is only overcome when we recognize that the adequate embodiment of Reason is in an actually infinite community of finite spirits. The rational spirit of forgiveness is "actually infinite," precisely in virtue of having surrendered its office of legislation. It is not legislative, but comprehensive; and its theoretical comprehension is also still practical, because it is reconciliatory. As an "experience of consciousness" Religion is more truly practical than theoretical, because the reconciliation of practical disagreements in the spirit of fraternity, and the absolution of the necessary consciousness of finitude as "sinful," is its logical goal.

When I speak of the "reconciliation of practical disagreements in the spirit of fraternity" it must be remembered that from the standpoint of common sense this "reconciliation" has a very Pickwickian meaning. The reconciled community continues to disagree; and its disagreements must at times be as absolute as Luther's defiance of the Council of Worms, or must reach the pitch of incomprehensibility symbolized in the story of the sacrifice of Isaac. Religious reconciliation changes nothing in the realm of "fate," and does not absolve us from the reverence that is the foundation of moral science.⁴ It is only our attitude towards these disagreements that is affected by the transition from morality to religion.

The essential function of Religion is the loving absolution of sin and guilt consciousness; that was why the logical inevitability of sin-consciousness in all practical experience, the logical impossibility of being dutifully conscientious, had to be brought home to the rational consciousness before the transition to Religion could be made "scientifically." The "hard heart" must break, the stance of direct identification with God's judgment, must be seen to be just as undutiful as the action condemned, before the true spirit of reciprocal forgiveness can be revealed. We shall see that that spirit of forgiveness is not just the final Gestalt of the moral Spirit, but the final Gestalt of religious experience as well. Hence, in order for Religion to be born in full self-consciousness, it is obvious that some of its shapes must have been experienced as "modes of consciousness" already.

Hegel begins his survey of Religion by reviewing these earlier modes of consciousness. What must be grasped before this review can even be understood, is that Religion proper is a mode of Self-Consciousness; in other words, we are the "self" of the absolute unity that we are now going to observe. The observed consciousness speaks of this actual infinity as "God," and it regularly adopts attitudes of "awe" and "reverence" towards God. God is a power who is "absolutely other" than itself in its sinful and mortal finitude. But at the same time, it recognizes itself, it comprehends its own spiritual infinity or "immortality," its own rational absoluteness, in this "absolute otherness." We shall be able to observe the exact parallel between the worshipping community and its God. For we already know that God is Spirit, and that this Absolute Spirit is precisely what constitutes the community of rational self-consciousness; and because of the "circularity" of Science, the end of the finite development (where we stand now) is identical with the beginning of the "biography of God in his community" which we shall now be observing.

*The divine power has a "categorical" status. It is what is recognized as common to, or identical in, all members of the worshipping community. It is only because this community is real, because the identity is "substantial," because our common human Reason is real and substantial, that we are "immortal souls." We have already seen that the final Gestalt of our eternal life is the "resurrection" of Christ in every worshipper. But that Faith is only a *Vorstellung*, the objective presentation of a pure Concept in the mode of Consciousness. The actuality of the infinite is the "Body of Christ" as a universal community of the spirit that embraces every mode, and every moment, of human rational awareness. The religious language is still a *Vorstellung*, but the actuality to which it refers can only be conceived. Dante can portray the Eternal Rose as a vision of Paradise, but the actuality of the infinite community is in our own present philosophical comprehension (and the subphilosophical but present experience of all its other members).*

As full self-consciousness, the religious consciousness that we have now reached was probably confined to a few intellectual romantics in Hegel's own time. This religious self-consciousness knows that the human spirit is the actual infinite (in the sense that I have explicated). But even in its most critically self-conscious representatives (identified for us by Hegel as Novalis and Hölderlin), the Beautiful Soul does not fully realize what the "infinity" of the Spirit means. The educated religious consciousness is ordinarily concerned with "reconciliation" as a practical problem. That is to say it is concerned with the actual community in its actuality, leaving its "infinity" to the obscurity and otherness symbolized by the name of "God."

The object of Hegel's chapter on Religion is to make the actual infinity of the human community appear in its visible concreteness. The "reconciling Yes" must not be referred to an ideal community of the future, or to a dream-community of the past—both of which owe their "beauty" to the implicit moral ideal of what ought to be. The "Yes" of Absolute Spirit must reconcile us with what is and with what will be, because it has been, and we have comprehended it in its necessity. So the ideal of community that we comprehended when we recognized the universal necessity of forgiveness, must now realize itself through the recollection of how our actual, far from holy, community has come to be. Only the recollection by the community of itself as an evolving self-consciousness—a "self-consciousness" which it quite correctly calls "divine" because the Self here is actually infinite—only this is its actual Dasein as free (or absolute) Spirit.

(a) *The Finite Phenomenology of the Concept of Religion*

1./672. We have encountered religion already, but only as the *object* of consciousness.

Just as the formal concept of Consciousness provided an abstract framework for the real career of the singular self-consciousness, so the forms in which we have encountered Religion as the *Gestalt* of "Necessity" on our journey through the shapes of finite Spirit will provide us with an abstract logical framework for the evolution of the "free" (or communally subjective) mode of being that we arrived at in the "Broken Heart." Until we arrived in the Moral World, we could encounter God only as an objective aspect of the conscious world of those "shapes of consciousness" that we were directly observing. In the earlier stages "God" was the "absolute essence" (*Wesen*). Thus "the divine" appeared, first, as the "Infinite" of the Understanding; and at the beginning of Self-Consciousness we were told that we were now in the "homeland of truth." This truth was characterized as the Absolute Spirit, "the I that is We, and the We that is I" (par. 177). The Absolute Spirit is the "subject" of our experience now. But in the world of the natural Self-Consciousness, we actually encountered God only as the absolutely Other Self, the Unchangeable He who is "Lord." In Reason God was absent altogether, because Reason was the kingdom of the finite selves. In "Spirit" He (or She) finally became "the We that is I, and the I that is We." But the finite spirit had to discover and know its own identity with the Absolute Spirit, before there could be any "scientific knowledge" of those earlier appearances. What we know at this moment, is that

God is simply the “I” of the contrite Beautiful Soul on one side, and the “We” of the absolutely comprehensive human community on the other. The name “God” cannot mean *more* than that, for if it could, there would be no Science of Experience. But it can mean much *less* than that. We shall now begin by surveying the “lesser” meanings that we have already met. Lingering with the “lesser” meanings, is the best (and indeed the only) way of deepening our comprehension of God as the Spirit that is both “I” and “We.”

- 2./673. First, Understanding was conscious of the Supersensible, but only as selfless. Then Self-Consciousness was aware of itself as the passion of Unhappy Consciousness straining unsuccessfully for objectivity. The unity of singular self-consciousness with its essence remained a Beyond. Reason has no religion, being occupied with the immediate present.

I anticipated paragraph 673 in commenting on paragraph 672; but now we must go into more detail. When the concept of the True Infinite was first formulated by the pre-Socratic philosophers, it was typically endowed not only with life, but with self-awareness. I shall not venture any guesses about the Boundless of Anaximander, but the Air of Anaximenes, the One God of Xenophanes, and the Nous of Anaxagoras are plainly supposed to have some kind of self-knowledge. Hegel here says, equally plainly, that the “divine life” of *his* Understanding is “selfless.” The system of Nature, as conceived in the Identity Philosophy, is “alive” (in the logical sense that it is not “mechanical,” but self-determining and “free” in the way that Spinoza’s God is free). But it is not a self, because it has no “other” in which it can recognize itself. To speak more plainly, we who are its “other,” cannot know ourselves in it, we can only know it as what is “absolutely other.” This is the general situation in what Hegel calls the “natural religions.” The divine is spoken of as a “self,” because the divine life is infinite, and it *comprehends* our lives (including our consciousness). But this comprehension is not, and cannot be, a “self-comprehension” (in any sense that *we* comprehend) until we can recognize ourselves in it. What we shall say at that point, is that the Infinite Life “recognizes us” (as its “children”). In the conceptual framework of the pre-Socratics nothing like that can happen. It cannot happen at all, in *any* pure monotheism. We simply cannot comprehend the selfhood of the One God in a conceptual way. For us (as thinkers) this absolutely infinite Being is “selfless.” The divine Life of the pre-Socratics is a “selfless” Infinite of the Understanding; and when Plato distinguished between the absolute status of the Ideas, and such theological myths as we find in the *Timaeus* and *Phaedrus*, he was clarifying the great achievement of his Ionian and Italian predecessors. In this world of Understanding, all talk of God as a self-conscious agent is sub-philosophical. It belongs to the level of the mythical imagination which the pre-Socratic thinkers successfully (but still imperfectly and incompletely) sublated. There is no “divine Self” in Nature (or, for that matter, in pure thought). There is only an absolute Substance. That is why Spinoza was justly condemned as an “atheist.”⁵⁵

The trinity of names that the Infinite is given in paragraph 162—“the simple essence of Life, the soul of the World, the universal blood”—had a vaguely pre-

Socratic, and a more definitely Platonic, ring to them. The new names that are introduced here ("the supersensible, the eternal") direct our attention to Kant and Fichte (neither of whom would have qualified the world-system as "alive" in any sense). For Kant "the starry heavens" are an object of religious *awe*.⁶ But that is only because they are "sublime" (i.e., they are "infinite" in the bad mathematical, or Newtonian, sense).

Hegel does not deny that this sense of "sublimity" *is* religious; for we shall see that he identifies it as the most abstract form of religious consciousness. But he agreed with Thales (and with Aristotle), that the lowliest form of *life* is more worthy of religious reverence than what is mechanical. So although he treats the awe occasioned by the Sublime—i.e., by what cannot be comprehended—as the first appearance of the Divine, he is emphasizing here how far removed it is from the truth of God as Spirit.

It is the Unhappy Consciousness, at the climax of the evolution of self-consciousness in opposition to nature, that marks the real birth of the concept of Absolute Spirit. That is why it was appropriate for Hegel to give the formal definition of his concept of Spirit—"I that is We, and We that is I" (par. 177)—at the beginning of his fourth chapter. The Unhappy Consciousness is the immediate experience of "universal sinfulness." That was where the two "pure knowing Concepts" (of par. 671) first appeared; and the absolution of sin by the human mediator was the first appearance of the Absolute Spirit as an object of "consciousness." But since that appearance is not self-consciously comprehended until the end of chapter VI, it is quite proper for Hegel to underline at this point, how the reconciliation achieved by Unhappy Consciousness fails to satisfy his formal definition of Spirit.

The reconciled Unhappy Consciousness does actually satisfy the definition of Spirit to which Hegel gave pride of place. The absolution of sin is a perfect paradigm of "self-cognition in absolute otherness" (par. 26). But at that stage the "otherness" remains almost *absolute*. The Unhappy Consciousness is saved in hope only; its union with God, its membership in the Body of Christ, is Beyond. It speaks of this world as belonging to God, and as sanctified everywhere by the footsteps of his saints. But anyone in its world who takes this talk seriously, and openly says that this Earth itself is the true "body of God" is a heretic whose body will itself be consumed by fire.⁷ "Objectivity" has not yet been attained. The experience of the world of desire and labor continues to be a merely "sinful" one.

The imperative of Absolute Spirit, in its most primitive form, is that, being infinite, it must *not* appear in the realm of finitude. Its evolution must take place first in the inner realm of the supersensible, the realm of pure thought. For this reason, the inward evolution of Absolute Spirit begins with its disappearance into "the Void"; Reason "has *no* religion" in any of its "peculiar shapes." It loses the sense of "the Beyond," or of "absolute otherness" altogether; it knows and seeks itself only in the immediately present world. In other words, Reason is the logical complement of the Unhappy Consciousness; and when this complementarity is recognized, the Unhappy Consciousness becomes "Faith." It achieves an estranged form of objectivity in its own inner world of Thought. As we saw in our

sixth chapter, in Reason's actual world, Faith and Reason go hand in hand. Reason is happy in the objective possession of this world, but it has no absolute aspect, no "true" infinity; and its criticism gradually drives Faith back into the self-conscious shape of "unhappiness."

For Reason as an "immediate *Dasein*," there is no "absolute other," in which it can recognize itself. Absolute otherness is just what is not rational—it is matter, the skull bone in which the rational observer tries, absurdly, to find the "necessary" record of the freedom of Spirit. When it is rationalized, this Other becomes the *Sache selbst* in which the common good is identical with our own rational self-interest, or the rational test that can justify either private property or communism indifferently. This discovery of "the Category" is a tremendous advance. But there is no "otherness" in it, just as there was no "sameness" (or Identity) in the "Other" of the Unhappy Consciousness.

In the historical perspective that we have now achieved, it must seem artificial to separate Reason from the Enlightenment both French and German. Each phase of the Enlightenment has a mode of religious experience that belongs to it (and Hegel will consider both of them in his review). But the historically artificial distinction between "Reason" and "Enlightenment" (like that between "Unhappy Consciousness" and "Faith") is imposed by the logical structure of Hegel's Science. He overcomes it for us through the connections that he clearly establishes between chapters V and VI. The discussion of Real Individuality is connected (through *Rameau's Nephew*) with the world of "Culture"; and the connection of Reason (both as Law-giver and as Test of Laws) with the Moral World-View is transparently obvious. The logical reason for the separation is supplied by the relation of complementary opposition which Hegel establishes here between the Unhappy Consciousness as essentially "otherworldly" and Reason as essentially "this-worldly."⁸

- 3./674. The ethical world had the religion of the *Underworld*: this was the cult of death, both universal (Fate) and singular (the Furies). As singular the essence is the self (and is present): but it is not properly universal. Universal fate is unconscious.

When we come to the forms of religious experience encountered in the chapter on "Spirit," the crucial point to remember is that "Religion proper" has been defined as "the *self-consciousness* of the spirit." Thus as long as the absolute truth appears to the finite spirit as an "object"—an "other" in which it does *not* recognize itself—it is not yet Religion proper that we have before us. This has the paradoxical consequence that classical Greek religious experience divides into two parts, one of which enters into the experience of finite spirit, and the other into that of Absolute Spirit. It was through the inversion of these two aspects of True Spirit, that the opposite sides of "estranged Spirit" emerged: the finite presence of the departed spirit in the family cult, became the infinite absence of the absolute Spirit for the Unhappy Consciousness; and the immediate identity with the Gods in the City cult, became the finite alienation of the actual cultural world for Reason.⁹

But for the moment, what matters is that Antigone's Divine Law is as objective, as positive, for her as the civil edict of Creon. She does not recognize herself in it;

and indeed, she is obliged to sacrifice the destiny of wife and mother, in which she wanted to recognize herself, for the sake of it. She actually recognizes herself in her *dead*. This is what makes the “religion of the Underworld” a proper religion. As we shall see in due course, Antigone’s religion is the sublated shape of “Natural Religion” in Greek experience. We shall meet it again (before its sublation) as the Egyptian religion of the Master Craftsman. It is the presence of “the negative” in the Art-Religion’s immediate affirmation of human life. That is why it both can and must come before us as the breaking point of “True Spirit” in its finite aspect.

The Egyptian cult focusses attention on the “other world”; whereas the function of Antigone’s cult is to maintain the presence of the departed spirit in this world, to save it from the “fearful unknown Night of Destiny.” In the finite conflict of the Furies with the self-conscious Law of the daylight, it is the universal negative might of the Night, the universal “Destiny” of death for the *Polis*, that is brought into presence. Antigone herself is sent to the dark realm of Hades for the “crime” of reverence to her brother’s memory. He is only a “shade,” a mortal like herself. But it is the “universality” of selfhood (as something that survives the darkness of natural death), that is maintained through the continuum of the dead with the living established by the family-cult. So Antigone’s own death in defence of that tribal piety, symbolically foreshadows both the mortality of the finite living community, and the immortality of the community of Reason.

When the City itself falls before the might of a military conqueror, it becomes evident that the negativity of the self in this bad infinite chain of the dead and the living, has not been successfully “turned over” into the positive form of spiritual immortality. The religion of Art perishes through its own dependence upon Nature; what remains as its heritage for the truly universal religion of Thought, is just the art that immortally portrays this tragedy (cf. par. 753). Destiny emerges, the power against which even Zeus is helpless; but it is “without the Self,” it is only that same “Supreme Being,” which the Understanding conceptualized as Force, and which we shall meet finally in the religion of Enlightenment. As the revelation of this absolute Object, this banishment of the self, Antigone’s religion, like the religion of Voltaire, figures very properly among the “world-shapes” of Objective Spirit.

We should notice that the evolution of Absolute Spirit begins with the survival of the “singular self.” The Greek religion of the Underworld is the sublated shape of natural religion; both the moments of the community of forgiveness—the “I” and the “We”—appear visibly, but as negated. On the one side there is the “pithless shade” in the darkness of the Underworld; on the other side, the universal community appears as the “Night” of human Destiny, in which the sunlight of Apollo will be engulfed. This universal side remains completely hidden in the darkness, but the moment of singular selfhood is present. Without Antigone’s immediate awareness of Polyneices—or the peasant-wife’s certainty about her dead uncle and brother—the Absolute Spirit could never come to be at all.

4./675. The faith in the nothingness of Fate, and in the Underworld, becomes [Christian] Faith in the “kingdom of Heaven,” because the self must have its proper universal

significance. But Faith thinks imaginatively, not conceptually; so it perishes in the Deist Eudaemonism of Enlightenment. Here the Infinite of Understanding is reinstated, in such a way that Reason can be happy. The Beyond is empty and not fearful.

Historically, the religion of the Underworld as part of this present world—the dark underside of this Earth, the hidden natural aspect of free spiritual existence—precedes the Unhappy Consciousness (compare pars. 704 and 750–754). It is preserved by the Unhappy Consciousness in the inverted shape of the Hell that awaits all who cleave to the things of this world, and seek their happiness here. The “true” Beyond is the intellectual Paradise of Dante’s Rose. Only through transformation by a complex (or “double”) inversion does Antigone’s faith in the presence of her dead become the Christian faith in the world beyond. Antigone’s faith is that even in the darkness, the nothingness of necessity, the community of the dead is really here (just as the daylight world is still really with us in the night time). The “Faith in heaven” is the opposite belief that this world is the world of darkness, and that death is the portal of true being, eternal life in the daylight of God’s presence. The departed soul is united with God in the positive infinity of the universal self.

It is the “universal” moment (the “We”) that is blacked out by the darkness of “fate” in the Greek experience. This moment becomes the community of “Hope” (the Church Triumphant) when the Christians preach that “Fate” is really Divine Providence.¹⁰ But as soon as the Unhappy Consciousness is overcome, and the rational self begins to take possession of its intellectual world, in the clear consciousness of Faith that “the Kingdom of God is within,” the critical conversion of Faith into rational insight begins. The destiny of the “Faith in Heaven” is to be transported to Earth, and recognized by enlightened Reason in the world of here and now. The terrible, all-conquering might of Destiny becomes, in the Enlightenment, just the empty concept of objective being. “Matter” is not an inscrutable and absolute Lord; and the “Supreme Being” is not a Supreme Lawgiver or Judge. The *Ding an sich* is a bogeyman only for dogmatic philosophers.

This “religion of Enlightenment” is what we could, with some justification, call the “religion of Reason,” since many of the Enlighteners called it so themselves. It does not postulate any Beyond except the “supersensible world” of the Understanding, which is just this world seen from its intellectual side. It is “without the *Begriff*” because it does not comprehend the relation of thought (the universal, the eternal, the infinite) to being (the singular, the temporal, the finite) as an “infinity” that concretely comprehends and is comprehended by (i.e. self-consciously embodied in) the finite. In order for Reason to make the transition to the Concept of itself as a spiritual process, it must “criticize” itself as Understanding, and “make room for faith” once more. That is to say it must become the moral Reason that “postulates” a supersensible world in which it can be “practical.” This is the phase of the Moral World-View which Hegel’s recapitulation now goes on to embrace.

5./676. The moral religion unites this negativity with the recognition that the absolute essence is a positive content. Its God is this self-displacing contradiction; and its Fate is, at last, the self.

The Kantian “religion of Reason” is the revenge of Faith upon Pure Insight. It is really the second act of the Enlightenment. But the Revolution and the Terror come between them. The *Critique of Practical Reason* was published just before the Bastille fell. But it was Robespierre who made it a “necessary world-shape.” The moralist of the Revolution itself was Rousseau with his “Law of the Heart.”

The guillotine forces us (as a rational community) to recognize that God is really there, and his Kingdom really means something (“the absolute essence is a positive content” as Hegel puts it). But the new dialectic of practical Reason only moves the older dialectic of Faith and Insight up, from the level of immediate conceptual identity (which corresponds to Sense Certainty) to the level of rational Judgment (which corresponds to Perception). We saw how the moral consciousness shifted from one position to another in its search for a harmony of duty and happiness, the supersensible and the sensible, just as the perceptual consciousness shifts from side to side with the “thing” and its “properties.” But now it is not the might of the Understanding that engulfs the whole cycle of shifting (as the law of natural necessity engulfed both the “divine” and the “human” law of Antigone’s ethical order). Instead it is the might of Reason that swallows up the bad infinite of the moral struggle towards holiness—the might of practical Reason as Conscience, the self that is certain of itself.¹¹

- 6./677. Thus we arrive at self-knowing Spirit as the pure *self-consciousness* of Religion. So far we have dealt only with spirit as consciousness. But in Conscience it became self-conscious (and dominance-hungry). It has still no free actuality (for itself) and no natural order over against it. It has a shape, but being only a subject, that shape is transparent; and all of its actuality is in thought only.

It is interesting that Hegel does not here recapitulate the dialectic of the Beautiful Soul as particular agent and universal Judge, which we have just gone through. Obviously there is a practical sense in which that was not necessary. Hegel had just written it, we have just read it, and we have only to turn back a few pages if we want to read it again. But the deeper reason for the omission, is that whatever happens to it, Conscience remains self-enclosed and autonomous. Even when the Hard Heart breaks, and exchanges its reconciling Yes with the community, this is the birth of a new spiritual community that exists only in and through the free mutual recognition of consciences. Thus Conscience is “the element” (as Hegel likes to say) of Religion as such.¹² The ordinary world, with all of its differentiated institutional structures maintained by law and custom, is now left behind.

Antigone set the world of custom in motion towards disaster by emerging from the dark privacy of family life into the public world. The motion ended when we saw the universal order of natural law come to grief by seeking to transform itself directly into the universal human family. Now, through the universalization of forgiveness and reconciliation in the sphere of Conscience, we have discovered how the universal family of humanity can exist. The community that is founded upon conscientious recognition is the Church. The world of nature, and of natural

necessity and happiness, has been sublated. When Hegel says that “in conscience the self-knowing spirit is now self-consciousness at home with itself (*bey sich seiendes*)” we have to understand that this is only properly true of the *broken-hearted* Beautiful Soul. It is the new community of forgiveness that “has brought *itself*, like its objective world generally, as also its *Vorstellung* and its determinate concepts, into subjection.” This is not something that is achieved dream-fashion, by writing a book. It is what we actually do when we come together to worship God in the spirit.

But, like the devotedly silent Unhappy Consciousness, we have left the world of natural enjoyment and work outside the Church door. “The universal spirit that contains all essence and all actuality within it” is here present with us and in us. But the presence is only a spiritual one. It is an abstraction of pure thought, like the concept signified by the expression “all reality.” Hegel does not want to use the word “spirit” in the alienated sense in which it is opposed to “body” or “flesh.” So the “Absolute Spirit” must now reach back and comprehend everything in our mundane life. This gives us the proper key for the understanding of chapter VII. The “Religion” chapter should not be read as the logical biography of the “Absolute Spirit” in its *otherness*. It is the community’s recollection and repossession of its “experience.” For we have already been shown that “Spirit” cannot subsist at all in its simple “otherness.”¹³

What, then, is the “*shape* or the form of being” that this Absolute Spirit has for us at the moment? When Hegel insists that the *Gestalt* of the spirit is “perfectly transparent to itself” he wants us to remember the fundamental thesis that “language is the *Dasein* of spirit.” The “reconciling Yes” is the logical minimum of “shape,” the word that must be “transparent” if there is to be a community at all. But it would be a mistake to suppose that words spoken or read, are the only “transparent” shape of spirit; on the contrary, it is clearly part of Hegel’s doctrine that anything utilizable as a symbol can be part of the “language” of spirit. His doctrine accounts for the iconoclasm of the Puritan reformers; but it certainly does not require it. We have only to recollect Hegel’s defence of Faith’s symbols against the charge of “superstition” (par. 553) to realize that the Calvinists were as much at fault on this point as the enlightened rationalists.

Putting all the other symbols in brackets, it is the congregation (Catholic, Anglican, Lutheran, Calvinist indifferently) saying the prayer, “Forgive us our trespasses as we forgive them that trespass against us,” and proceeding to the Doxology (“For thine is the Kingdom, the Power and the Glory”) that is our initial *Gestalt* of Absolute Spirit. In paragraph 677 Hegel is setting up a logical extreme. We are going to make a great turn at this point, and begin to take possession once more of the world outside the Church door—the whole world of our actual experience. But as we now enter “the kingdom of God” we come with nothing; we have “subjugated” it all, and put it behind us. It is all left outside. Like the Unhappy Consciousness, our philosophically religious consciousness is a communally spoken prayer. But we are saying it in our own language, and not in the Latin of the world-conquering lawgivers.

(b) *The Shaping of the Concept of Religion*

- 7./678. So in religion, the world of consciousness is not given its independent recognition. Spirit has these *two* worlds, its secular and its sacred existence. *We* know it is the same spirit in both; and the perfection of religion comes when *it* knows this too. But in religion spirit images itself, and its actual world is only the outward shape and garment of this pictured inner essence. So actuality does not get justice yet as a free existence; and it is not spiritual yet, being a definite shape. Absolute Spirit must have its actual world as its object. Only when it is recognized as spirit itself, does the world have free actuality.

The *Dasein* of the Absolute Spirit is the whole actual world; the utterance of the Divine Word is the order of Nature. If we remember this theological doctrine, then we can interpret Hegel's statement that in Religion the *Dasein* of the Spirit is distinct from its *Selbstbewusstsein* without abandoning his thesis that "language is the authentic *Dasein* of spirit." Religion, as an experience of the community, is necessarily a cult, a set of practices mediated by words and symbols. It can be an everyday affair, not distinguished in a temporal way, as the Sabbath is from the six days of labor. But as the conscientious self-consciousness of Absolute Spirit, it must have an identifiable linguistic shape as an act of self-definition; and this linguistic form has to be distinguishable from the whole world of finite speech and action (as well as from the world of natural events). For what is present in this communal experience is the Absolute Spirit.

What we say in order to express this absoluteness, is that the "speech" of this Spirit was the very *Creation* of the world. This is paradoxical, because in the ordinary way our speech appears to separate us from our actual world, instead of "creating" it; so the absolute Spirit gets the look of an alien "Lord" who speaks in quite a different way than we do. But this Spirit is a community; and what it creates by speaking is what can (and must) be "created" by speech: the conceptual framework of shared communal interpretation.

If our experience in Religion is to become "absolute knowledge," then the alienation of the Absolute Spirit in religious devotion must now be overcome. "The kingdom, the power, and the glory" are not just to be spoken of in Church; they are to be experienced. When Hegel pitches us straight back out of our purely intellectual devotion, into a religious consciousness that makes *no* distinction between God and Nature, but recognizes God's Word directly in the light of the sunrise, he is claiming that this is what the first verse of Genesis and the first verse of John really mean. If we are willing to follow him on this road, then by the time we reach his "manifest religion," we shall be obliged to confess that it is *not* identifiable with any traditional form of Christianity at all.¹⁴ Hegel knows this perfectly well.

The language of religion reduces the actual world to a *garment*; but the actual world of Nature and finite spirit cannot properly be reduced to a merely phenomenal cloak. It is to become "independent free *Dasein*." We shall begin by experiencing God in his own "Word" (i.e. in the sensible order of Nature); and by the time we come back to the consciousness of God as Spirit, it will be manifest to us that

the perfect shape of God is not a “determinate” one at all (not, for instance, the one that calls itself the “Christian Church”) but the shape that is truly “catholic”: the World-Spirit. Hegel can properly be called a follower of the man, whom his first followers called “the Christ,” because the “self-conscious spirit” of both of them is the spirit of reconciliation with human experience universally. But Hegel is not a “Christian” (any more than the man called “the Christ” was) because the Christ-symbol is only a verbal “garment” for his speculative truth—and one that must in the end be cast off in favor of the actual order of nature as the independent “living garment” of the Spirit. Goethe’s Earth-Spirit can speak of Nature as God’s “garment” because he is himself its “independence.” This salvation of the “independence” of nature is necessarily involved in what Hegel himself calls the “seeming demand for the opposite” (i.e., for absolute spiritualization).¹⁵

Nature and Spirit are to be reconciled. The actual world which is the object of consciousness in chapter VI must regain the form of free living actuality that it had in the manmade Paradise of True Spirit. Within the political realm it cannot do this—that was one aspect of the lesson of the Terror. But it can and should “come alive” in Religion. The alienation of the spirit from the flesh (which was essential to the very genesis of spirit as “absolute”) is to be absolved in its achievement of absolute self-consciousness. To put it another way, religious experience is not something that can happen in Church; only the awareness of what is *meant* can be generated there. The experience itself must be generated in life (and in every aspect of life). For there is no other life than this present one; and the experience that is conceived in church refers to it—even though that experience does in a crucial way involve the part played in this life by those whom we call “the dead.”

- 8./679. What we have completed so far is the phenomenology of Spirit as actuality. All of the moments (Consciousness, Self-Consciousness, Reason and Spirit) are contained in the religious Spirit (or Spirit’s self-consciousness). Only the whole spirit (as Religion) is properly in time. But the singular phases of Spirit’s moments [e.g. Sense-Certainty, etc. for Consciousness] do have their own religious expression in time. These *phases* are in time, while Consciousness, Self-Consciousness, etc. are the middle terms for the actualization of the historically singular totalities. The process of development is cumulative so that the later phases still contain the earlier ones.

The *Dasein* of Absolute Spirit is the total experience of the *Weltgeist* all spread out in space and time. In this sense, Absolute Spirit is the “Word, by which all things were made”; and this is the ultimate sense in which the *Dasein* of Spirit is language. We have to grasp that this is not just a theological metaphor. It expresses the logical truth that all modes of consciousness are modes of human *self-interpretation*. Our “science of experience” has now organized all of the finite modes in which we interpret the world into the series: Consciousness, Self-Consciousness, Reason, Spirit. In this series of finite shapes “Self-Consciousness” does not mean the self-consciousness of Spirit; and Hegel himself makes this point by remarking that (within this series) “Spirit” itself means only the actual finite communal spirit

that is conscious of an external world. It is *human religious* experience that is the “self-consciousness” of the Absolute Spirit.

Spirit does not have its properly absolute Self, until we become its self-consciousness as philosophical historians. We have to forgive and forget the moral struggle of singular agents, and observe how the social substance expresses itself as a subject in *all* of the active singular consciousnesses who are themselves preoccupied by their moral struggles.

Of course, being well schooled in the *academic* ethic of forgiveness (at least), we have been observing “experience” from this “absolute” standpoint all the time. We could see that Antigone’s law of Zeus was *one* side of Spirit as Substance (and that Creon spoke for the other side); we could see that Culture’s doubled world of actuality and thought was really one world doubled by thought; and we could see the shifting of moral self-consciousness as it moved step by step towards the hypocrisy of identifying with God as the Last Judge. This is the sense in which (because we are speculative observers) the “Absolute has been with us from the first” (as Hegel implied in par. 73).

The whole story of our Science began (in the Introduction) with the “sceptical” (or theoretical) version of this absolute observation—the Kantian “last judgment” which knows absolutely that because of the structure of consciousness we cannot know anything “absolutely.” There too, the key to our undertaking was to have faith in our own cognitive certainty that “the Absolute is with us.” But now that we have made the journey we can see why critical scepticism is so natural. “Finding out where we are” when we adopt the stance of the critical observer is a long and complex task. We have to begin by trusting the instinct of our natural consciousness, and letting it criticize itself progressively. Then, in the end, we discover that our speculative observing standpoint is properly just the “compassionate” attitude that our religion ascribes to God. We have only been able to do what we have done, because of the attitude that our religion prescribes as the proper one in respect of critical judgment.

We are now going to observe how this model came to be the absolute standard prescribed by our cultural world. Until we had consciously appropriated the model, and appreciated its significance, we could not even formulate this project. The “phenomenology of finite spirit” we could complete by making an act of faith in our own critical capacity as a positive criterion of truth. We only had to recognize the “absoluteness” of our critical power of self-examination and self-condemnation. From the circle of its “infinity,” a new shape of positive experience was continually born. But the phenomenology of Absolute Spirit cannot become manifest for us, unless we consciously know at the beginning just where it terminates, just where the “biography of God” comes to an end, and “God dies.”¹⁶

When we embarked on the “finite” journey we had the natural beginning of the pilgrimage plainly before our eyes; the guiding thread of natural certainty was at hand, as soon as we were ready to abandon our intellectual doubt and pick it up. Now, as we set out on the “infinite” journey, we already have the knowledge of where it ends. Our observing consciousness stands at the climax of the evolution of

Religion, and we have the experience of the “Manifest Religion” already as a simple result. We must now apply the pattern of our finite journey to the history of our religion; and that is no easy task because Religion is the self-consciousness of human culture as a totality.

“Der ganze Geist nur ist in der Zeit”—“Only the *whole* Spirit *is* in time.” Religion is “the whole Spirit”; so it is the religious consciousness that is properly *historical*; only the religious consciousness of our culture exhibits itself as a temporal sequence of fully concrete and independent *Gestalten*. The moments of Consciousness, Self-Consciousness, Reason and Objective Spirit do not properly form a temporal sequence. As we have seen, it is not impossible to recollect the evolution of the singular consciousness in a historical sequence. But “Spirit” is the “shape” from which all of the strictly singular *Gestalten* of these moments emerge, and into which they return (par. 440). “Spirit” has a history (which is essentially the evolution of our religious consciousness of ourselves as a community in God); and we have already found in that story some of the crucial moments at which the paradigms of singular *Gestalten* are most easily recognized; but these finite paradigms do not come in a temporal sequence.¹⁷

Hegel claims here that the *phases* of Consciousness, the phases of Self-Consciousness, and the phases of Reason form a temporal sequence in the evolution of Religion, even though every cultural whole must involve Consciousness, Self-Consciousness and Reason together. Hence, as we shall soon see, there is an *absolute* shape of Sense-Certainty, Perception and Understanding. In these absolute shapes of simple Consciousness, both Self-Consciousness (specifically Lordship); and “Reason” (e.g. Wisdom, Creative Power, Justice) will be attributes of the Absolute Spirit in the mode appropriate to the phase of Consciousness that the culture as a whole has reached.¹⁸

Hegel’s plan is to look for each specific “phase” or *Gestalt* in the cultural world in which it is dominant. The individuated *Gestalten* of consciousness—in an associated mode-cluster of Consciousness, Self-Consciousness, Reason and Spirit—with their differentiated standards of truth (or “the essence”) will be identified one by one as complex “shapes” of community; and these complexes will constitute an evolutionary sequence in our actual cultural history; for every succeeding *Gestalt* “retains the preceding ones in it [or upon it].” We shall find that the historical mapping of “Religion” onto the logical sequence of conscious shapes is quite difficult. But this programmatic promise should always be in our minds.

It is the *historical* character of all consciousness that logically determines the phenomenology of Religion. The evolution of singular consciousness had to begin “here and now,” because it starts from the logical fact that only the thinker who *exists* can know the truth. But the primary fact of consciousness for that thinker is not that she thinks, but that the world was already there to think about before she came into it. Thus for any thinker, the evolution of “substance” as natural and social is primary, and the shapes of Consciousness (Sense-Certainty, Perception, Understanding) must come first.

Hegel has still to tell us just how the conceptual moments (Consciousness, Self-

Consciousness, Reason) which cannot be culturally individuated serve as the “determination to singularity.”¹⁹ But it is noteworthy that he already says here that “the shapes of these moments *make up* [*ausmachen*] the singularity.” So it is clear that the “moments” will “determine the shapes” in sets (since every culture is a living unity of Consciousness, Self-Consciousness, Reason and Objective Spirit). Just how the singular “shapes” of Consciousness are combined into determinate shapes of Absolute Consciousness Hegel will now try to explain.

- 9./680. *Together* the moments [Consciousness, etc.] make up the subsistent actuality of Spirit as a whole. But their movement through their phases contains the evolution of absolute Spirit. Thus these phases [Sense-Certainty, etc., Desire, etc.] provide us with the species and sequence of Religion itself. Spirit as a whole must go through these phases until its shape for its own self-consciousness is the shape of self-conscious knowledge. Every shape of Religion has its actual world too; and the moments [Consciousness, etc.] are developed together at an appropriately parallel level in that actual world. Every aspect is stamped by the same seal.

Hegel has already said long ago that Consciousness, Self-Consciousness and Reason are abstract moments that emerge from and return into Spirit (par. 440). And it is clear that, with respect to Consciousness and Reason at least, he was interested in the way they emerged from and returned into the “Spirit” of his own world. His discussion of Self-Consciousness, on the other hand, seemed more oriented toward the emergence of his World-Spirit from an earlier world; for serfdom, Stoicism, Scepticism, and the defeat of the Crusaders, all belong to “Spirit in self-estrangement” rather than to the “Self-Certain Spirit” of Germany after the Revolution.

The discovery that what we dealt with as “Spirit” in chapter VI is only our World-Spirit’s simple consciousness of its own objective world unfolding in a temporal order as the phenomenology of its own “Self-Consciousness”; and that *all four* of the conceptual moments (Consciousness, Self-Consciousness, Reason and Spirit) “return into Religion as their ground” (just as the first three were already said to return into “Spirit”) helps us to understand the ambiguities of temporal reference in the first three moments. Sense-Certainty, Perception and Understanding belong to Greek intellectual development as much as they do to Europe since Francis Bacon; Stoicism, Scepticism and Unhappy Consciousness belong to the Renaissance, the Reform and the Enlightenment almost as much as they do to the Universal Empire and its Universal Church; Observing Reason (including Physiognomy) is as much Aristotelian as it is Shakespearean; and Hegel himself points out the intended *contrast* between classical and modern Virtue and Lawgiving (pars. 390, 355, 420–422).

The explanation is now clear. The Absolute Spirit is the religious self-consciousness that recollects the whole evolution of “Christian German” culture from its classical origins to the present in order to become truly “absolute” by comprehending human experience as such. It is logical therefore that “Understanding” comes to a Platonic (rather than a Laplacean) climax; and that “Real Individuality”

arrives at a Kantian (rather than a Socratic) paradox; and it is logical that the whole movement of "Self-Consciousness" (as the middle) belongs more to the Middle Ages than to the pagan, or the nationally-Christian, world.

As we could see in chapter VI all three moments (Consciousness, Self-Consciousness and Reason) belong to all three of these time-worlds. But their function in our Science is to mediate the three worlds of chapter VI into the Unified Self-Consciousness of our fully individuated World-Spirit. That World-Spirit (as absolute Self-Consciousness) is a religious consciousness of the universal human community that has come to birth only *now* (in the "birth-time" mentioned in par. 11).

It could not come to birth earlier. The "Religion" whose "absolute" phenomenology we are now about to trace is no older than Hölderlin's *Hyperion* (and Hegel's unpublished manuscripts). Indeed, it is no older than Hegel's inverted reading of "the hermit in Greece." It was not born with Peter's recognition of Jesus, the sin-absolver, as "the Christ"; nor was it born with the conversion of Paul, Constantine or Luther. It is a Church in which Antigone is one of the saints; and we shall soon see that Zarathustra is one of the founders. It is only when we read chapter VII this way, that we can make sense of the assertion that "Religion" is "the *Vollendung* of the Spirit into which its singular moments . . . Reason and Spirit *return* and *have returned* as into their ground." The "have returned," in particular, makes no sense unless the whole record is conceived as eternally conserved. This is the "mind of God"; and it is *we*, the scientists of experience, who have given it that eternal status.

But now Hegel calls Consciousness, Self-Consciousness, Reason, and Spirit, the "attributes" of Absolute Spirit (as Substance). "Attributes" are what "God" has, both in the theological tradition of Faith, and in the Spinozist tradition of Insight. But it is paradoxical for Hegel to call "Spirit" an *attribute* of God; for in the Preface (which is the only place where the word "God" is allowed to appear before par. 671) Hegel reminds us that the "*Vorstellung* of the Absolute as Spirit" is "the most sublime *Begriff* and the one that belongs to the modern age and its religion" (par. 25). The finite spirit of chapter VI can only be an "attribute" of the divinity that has not yet achieved its conceptual maturity—i.e. of the Substance that becomes a Subject in Religion. So when Hegel speaks of Spirit as an "attribute" of the absolute Substance in its process of becoming, he is giving the *substantial* "We" (or humanity as *Nature's* consciousness) the primacy. We can call even spiritual self-consciousness an "attribute" of our philosophical community, because "the Absolute is just as much Substance as Subject." But when we speak of the absolute community with its religious self-consciousness—i.e., when we speak of the Absolute Subject—the "attribute" terminology becomes inappropriate, and we shall speak rather of the "predicates" of the Absolute Spirit. (Hegel makes this point in the next paragraph, par. 681).

The religion of a community that has not arrived at absolute "self-consciousness" will not be fully "spiritual." But as a concrete whole in which the first three moments are comprehended it will *have* a Spirit (both "absolute" and "finite") of its own. Thus, the Greeks have, in their Olympian cult, a religion of Reason, in

which the distinction of the free (the Greeks) and the naturally-dependent (the barbarians) is understood as a “law of nature.” In other words, the “Self-Consciousness” of this communal spirit (its “subjectivity”) is a “natural” one. Human Freedom is conceived as a second nature that is self-made. Zeus gives the Greeks their “natural” law; but this is only the universal foundation upon which every Hellenic community self-consciously builds its own way of life.

Thus the Olympian religion is the religion of Reason as the defining “attribute” of human *nature* at its full development. Because of their collaborative relation with the community, the Greek lawgivers are quite different from Moses—and still more different from Hammurabi. It is because they exhibit *natural Reason* in its fullest development, that the Greeks (as a nation of warring *poleis*) are the community of True Spirit. The Hellenes are the universal spirit of humanity; but they do not yet know what “Spirit” is. That is a paradox, because Spirit eventually *is* what it knows itself to be. The concrete resolution of this paradox in existence is the spontaneous synthesis of necessity and freedom in Art. The Greek community creates its own nature, by “following” nature. In Consciousness the Greek community is at the level of Perception; in Self-Consciousness they are at the level of Dependence/Independence; they have reached Virtue at the climax of Active Reason; and they are the True Spirit. (This is probably the simplest and most obvious example of a mediated set of “determinations.”)

We had to experience the “attributes” of actual Spirit (Consciousness, Self-Consciousness, Reason) and the attribute-phases of Absolute Spirit (“Truth” or Identity, Self-Alienation or Judgment, and Syllogistic Self-Certainty) in order to discover what the absolute Selfhood of the communal Substance is: the community that substantiates its own identity in the spirit of forgiveness. We saw on our journey that each of the moments has its own “infinity.” Each of them is “eternal” and self-maintaining. Even the Sense-Certain Consciousness is an immediate objective certainty of “absolute being,” although it is a subjective experience of absolute nullification. This objective certainty of sense-consciousness was validated in the intellectual Infinity comprehended by the Understanding. Similarly we saw the natural self-consciousness move from the experience of death to the absolute consciousness of penitent reconciliation; and then Reason moved for us through the absurdity of natural necessity to the empty, or “bad,” infinity of pure freedom: but this turned over directly into the infinity of “True Spirit” (which Hegel was careful to introduce at the beginning of Active Reason [pars. 349–354], and to remind us of in Lawgiving Reason [pars. 420–421]).

It is “those complete cycles of the singular sides” which “contain the determinacies (*Bestimmtheiten*) of religion itself.” The motion of the concept of Religion through these “cycles” corresponds to the motion of actual Spirit. It is a motion away from immediate “Truth” (or identity with God) into self-alienation, and towards the achievement of self-recognition. What is finally recognized or known is the Self-identity that was there “in-itself” from the first. But the difference between the way Antigone and Creon are conscious of Zeus (and the City) and the way in which the acting and the judging conscience are conscious of the Risen

Christ gives us some idea of the contrast we shall find between the “in itself” and the “in and for itself.” But in the full evolution of Religion the contrast will be much more extreme, because the process must reach right back to Sense-Certainty.

The motion has three moments: Identity, Self-Alienation, Reconciliation. These three moments must each go through the “determinacies” (i.e., the subordinate phases) of Consciousness, Self-Consciousness, and Reason in different patterns. All three of these “attributes” belong to every actual Spirit, i.e. to every cultural world. The absolute Self-Consciousness of each world will therefore exhibit (as universal traits, or “predicates”) differentiated patterns of the *Gestalten* of consciousness; and the perfect “infinity” of that “phase” of the particular moment which mediates the development, will determine the particular *Gestalt* that is realized in each of the other moments.

Hegel says that “the *determinate* shape of the religion grabs up (*herausgreift*) for its actual spirit, the shape of each moment that corresponds to it.” It is vital to realize that no transcendent subjectivity is involved in this “grabbing up” of a particular *Gestalt* of Consciousness, Self-Consciousness, and Reason.²⁰ There is only the human community building its own way of life in the natural environment. This is the “actual Spirit.” By its conscious (but only very inadequately self-conscious) self-definition within the context of its grasp of natural necessity, the community creates a “destiny” for itself, to which it gives religious names. But there is nothing “beyond or above” it, except the natural necessity which it has not yet comprehended, and the rational freedom which it has not yet achieved. The community speaks of the power that it supposes to be in charge of its “Fate” as “God.” But its “God” is only the objective portrayal (*Vorstellung*) for itself of the stage that its self-definition has reached. That is what we—who know the ultimate “shape” of God as “absolute Spirit”—can see clearly from the first.

It is a mark of the “natural rationality” of the Greeks, that they realized that their “God” was *not* in charge of Fate; “Self-Consciousness” is actively emergent in Greek religion, because their Divine Family images the Greeks themselves as a community. “Fate” is a better name than “God” for the divine Lord of natural religion, because that “Lord” is not a proper “self”; and the Greek “Fate” is the *understandable* shape in which *absolute* Spirit finally emerges. Hegel speaks of “God appearing,” only when the community understands its own function of forgiveness. Until then, “God” (as a subject-name) identifies only a necessary “transcendental illusion.” Fate we must always reverence; but rational beings do not worship the Big Bang. But when we arrive at the consciousness that “God is Love,” we are recognizing a divinity whose very being is constituted by our recognition. Nature forgives nothing. There is no “spirit of forgiveness” anywhere except in human self-consciousness. That is what God’s necessary “Incarnation” conceptually signifies; and “nothing in fate is changed by it”²¹—any more than Fate could be changed by Zeus.

10./681. So the shapes of the moments will emerge in a different ordering than they did in the evolution of self-conscious Reason. Each moment shaped itself into a whole then; and cognition was the spirit in which they had substance. This substance has now

emerged as the self-certain spirit that assembles its moments and stamps its character on all of them. Previously, Consciousness, etc., formed for us a series of circles knotted onto one another (the knots marking the return of each “shape” into that spirit). Now, each religion will be a circle bonded by its distinctive character, in which these unknotted circles become radial lines. We shall see how the religion comprehends all the distinctions, not as separable parts, but only as moments or aspects of the circular whole—attributes of its social Substance, predicates of its religious Subject. But the spirit of each circle knows itself under just one of the distinct shapes.

Since the “shapes of consciousness” will now appear in patterns determined by the determinate phase within which the religious community knows itself, it is a truth of formal logic that they cannot appear in a simple sequence like the natural numbers. Each of the series, Consciousness, Self-Consciousness, Reason, Spirit, went through its cycle of development until it reached its “infinite” shape; and in every case the “infinity” was quite the opposite of the finite *Gestalten*: the supersensible took the place of sense, consciousness of the infinite self took the place of self-consciousness, the Ethical Substance took the place of discursive reasoning, the One Law and the Many Atoms replaced that Substance, Terror replaced the Order of Faith, and finally union in forgiveness took the place of dutiful autonomy. In this way each of the moments “deepened itself” and became eternally substantial as a necessary attribute of philosophical cognition. The finite shapes appear and disappear; but when we grasp the “ground” of each cycle, we *know* that the “spirit” into which they disappear is always there (just as sense-certainty knows primitively that “the firmament” is there, and that the cycle of night and day will not fail).

When the “True Spirit” of the finite rational community goes through its total cycle, and finds *its* ground in the infinite spirit that “forgives” the whole tragic record of our culture, then “the substance [of cognition] has come forth.” The self-certain Spirit is no longer hidden in the noumenal darkness of the Moral World. It is out on the stage before our eyes. Like Dionysus in the *Bacchae* (or like Mephistopheles) it will let no finite shape assert its independence, its self-sufficiency. But like Christ on the Cross it freely gives what cannot be claimed as a right. The absolute Spirit is the spirit that gives “life” to all of the finite shapes of consciousness.

In the advance of the finite natural consciousness to its infinite self-consciousness, the cycles of Consciousness, Self-Consciousness, Reason, and Actual Spirit, are all necessarily bound together in sequence. In our science, we have seen each of them become a circle; and the “knot” that closed the circle at each moment of completion, was the starting point of the next circle. So all of the circles form at the same time a single string.²² But now the genesis of the infinite self-consciousness requires that the circles (of Consciousness, Self-Consciousness, Reason, and Actual Spirit) must be separated from one another. The *joining* knots must be severed, and the one string must become four strings. Every historical phase of religion is a circle in which the shapes of Consciousness form not a *series* (*Reihe*) but a *bonded group* (*Bund*). Each *Bund* is bounded by its distinctive character (*Unterschied*). There must therefore be at least four radial lines in each religion-circle, determined by the parallel development of Consciousness, Self-Consciousness,

Reason and Actual Spirit. These four “middle” terms must be present in some logically determinate shape at every stage; and the *absolute* Religion (whose defining characteristic we already know) must comprehend within itself *all* of the necessary “determinacies” thus generated.²³

Hegel hastens to add that it does not comprehend them positively—or as *parts* of its extension. His metaphor of the “directions” (the many strings defining a series of circles) is not meant that way. In our science of actual Spirit, Consciousness, Self-Consciousness and Reason were “attributes” of Spirit as their “substance.” But in religion they are “predicates” of the communal subjectivity; and the scientific observer of the “phenomenology of Religion,” must focus her attention upon the defining predicate of the *Bund* at each stage. *All* of the forms of consciousness—not just the one that determines the actual radius of the religious circle that we are observing—are present in the religious spirit at every stage of its appearing. But it is the shape under which the community knows its “absolute self” or its essence that matters. For example, “death” and “resurrection” are “predicates” of the Absolute Spirit long before the Gospel is proclaimed; but these predicates of God are not the *essence* of the religious community before the conversion of St. Paul. Just how the earlier distinctions survive as “predicates” in the absolutely self-conscious Spirit we must study when we reach it.

(c) *The Bare Concept of Religion*

- 11./682. At the end of the development the distinction between actual life and religious consciousness is overcome. But to begin with, Religion is an unmediated self-concept not yet opposed to actuality. Spirit in the form of immediacy is simple Being, but the being is spiritual. It is the absolute unity of Spirit, so its falling into abstract objectivity disappears. Experience happens within this unity, and so God as the self-concept is not yet “the Creator.” He produces only his “shapes.” The movement of these shapes is the Spirit’s movement to its full actuality.

The last distinction to go will be the distinction between the actual world as organized by the community, and the God-consciousness of the community. That distinction was what the last two “sides” of the self-certain spirit of moral Conscience—the social world and the Hard Heart—represented. The sublation of that distinction in the evolution of Actual Spirit, gives us one of the two extremes that must coincide in the immediacy of the “Being” that is “Spirit.” It is only a “pure Concept” that is posited when the “reconciling Yes” is spoken, because the religion of Conscience is absolutely *inward*. This Concept is the logical key by which the whole range of human religious experience is to be unlocked; but we have only to remember the helpless impotence of Faith in the grip of the Enlightenment, to see that the key is worse than useless unless we know what lock to put it into first. In that respect it is like the Kantian critical certainty with which our finite journey began. Just as the critical spirit can turn readily into scepticism and formalism, so the spirit of reconciliation can turn into despair or quietism. The proper destiny of

religious *self-certainty* (which is what we have achieved so far) is to be transformed into “truth” (like the certainty of “Reason” and “Spirit” before it); but that destiny must be achieved *methodically*.

The congregation in our Christian church is *certain* that God has appeared.²⁴ God has appeared to this community “immediately” in his *absolutely* distinctive character. But outside the church door there is still the world, which—according to his concept and their faith—God created and sustains. This faith is the “certainty” that fills their objective concept as its substance. They have inherited it from the Unhappy Consciousness. They are certain that in being one with God and in God, or in their properly conceptual overcoming of the Unhappy Consciousness, they are substantially united with the Spirit that is “all in all.” But they need to know how this is so, and what it concretely signifies. The world is not now alien for them in principle, because it is “God’s world,” his abiding shape, the embodiment of his Word. This acceptance of embodiment is the first step in that “self-recognition in otherness” which distinguishes the self-consciousness of spirit from natural self-consciousness. So this Concept of God is the “pure consciousness” within which their awareness of the division between the infinite and the finite, religion and life, Church and State, is situated.

Because the Concept of Spirit is founded upon this recognition of the concrete *identity* of thought and being, self-consciousness and consciousness, mind and body, Hegel’s “Christian” religion is unorthodox in its interpretation of the Creation. In the Biblical tradition God created by “speaking.” What speech “creates” is its own embodiment. Thus God’s creative activity as Spirit has to be conceived as the *progressive* creation, not of the eternal order of Nature grasped by the Understanding, but of the embodied community of Reason (in which self-consciousness and consciousness are known to be substantially identical from the first). Thus, for this philosophical congregation of reconciled beautiful souls, the “creation of the world” signifies God’s creation of Himself as Spirit. Only by creating Himself, can God exist as Spirit at all, for it is the essence of spirit to make itself. Nature (and the Understanding that is conscious of it) is simply a necessary moment in this more comprehensive concept of what “truly is.”

There is no “self” involved in the process, except the one that comes to be through it; and the deepest truth about that “One” is that it is necessarily the infinite unity of the many finite selves who are members of its community. This is the final movement of self-recognition that the community will pass through. But there is a major problem at the very first step, because our self-consciously enlightened community must conciliate its awareness of the “reconciling Yes” with the first article of its “faith”: that “God the Father is the maker of heaven and earth and of all things visible and invisible.”

In the “self-creation of God,” which we as the self-conscious *concept* of God are now about to observe, the “creation of the World” can be characterized more accurately as the progressive appearing of God as the World-Spirit. The world is interpreted by the naïvely religious finite consciousness as the manifestation of a spiritual power which takes different “shapes” as it evolves. The religious

consciousness does not begin with a theory of Nature as something *other* than Spirit (still less with a theory of sensation, matter, motion, mass, force, laws etc.). God (or the divine power) is immediately present everywhere. The “riches” of Sense-Certainty are now fully restored, because every experience of the world is a “theophany.”

The end and the beginning of the story will indeed coincide, because every moment of experience will be “full of God” again, when we have “fulfilled the Concept” completely. But the distinction between God and the actual world has not yet “returned into” this naïve Spirit, because that distinction has not yet been made at all. This constitutes the difference between “us” as the fully self-conscious Concept of Religion, and the newborn objective Concept that we shall now observe. It is the most *absolute* difference possible—the difference between the being and the nothingness of *cognition*. But it is a difference that can only be “meant” (not pointed to) because our Concept has intentionally *returned* to the immediacy in which the *naïve* Concept is born. Even in the newborn Concept, a distinction between “essence” and “appearance” necessarily comes to consciousness. The “essence” is a Beyond. God “appears” as a sequence of shapes, which are the first stages in the actualization of our own perfectly rational Self-Consciousness. The history of religion is the complete actualization of this self-concept, through the actualization of its “singular sides” in a logical sequence. “God” can only stop evolving when his “essence” coincides with our present actual consciousness of him.

- 12./683. The first shape of the divine spirit’s actuality is the immediate concept. Here the absolute spirit knows itself as *Nature*. The second shape is that of the self as a sublated nature. This is the *artistic* religion. The shape assumes the form of self, because it is produced by a consciousness that beholds itself in its work. The third shape reconciles these first two in the unity of consciousness with self-consciousness: the *manifest* religion. This is the true shape of Spirit. But now “shape” (and the imaging of shapes) must pass over to conceptual form. Then spirit will know itself as spirit.²⁵

The *immediate* consciousness of God must begin naïvely, where Consciousness itself begins. What is immediately certain in thought, is also immediately certain in being. Hence the beginning of the absolute phenomenology of religion is a comprehensive inversion of the immediate certainty (reached in par. 671) that God is self-conscious spirit in us. If he is indeed the living spirit in us, it is first because he is the spirit of the world out there upon which our mortal bodies depend. The spiritual certainty of God’s presence is identical with the sensible certainty of his power. Hence the absolute Spirit is (necessarily) the sustaining power of the world that appears to us finite spirits. The sensible world is God’s expression. That “the heavens declare the glory of God” is the primitive certainty of Spirit. But the Psalmist’s further claim that “the firmament showeth his *handiwork*” involves an act of the Understanding; it is no longer an “immediate” certainty (in the sense that there are simpler and more naïve ways of expressing an *immediate* identity).

This very simple and familiar quotation from those Scriptures that our ideal

congregation regards as holy, teaches us that we must go elsewhere for the *immediate* certainty of identity. We must certainly go back beyond the world of True Spirit, because that is the world in which the absolute Self is first conceived “spiritually” (i.e., as self-made by the human community). We have to distinguish three religious worlds: that in which the absolute Spirit is known as the sustaining Force of the world of Consciousness; that in which it sustains the natural Self-Consciousness, and is Lord and Master of the world of Consciousness; and that in which Spirit is revealed to be the Reason that is certain of the identity of Self-Consciousness and Consciousness.

It is interesting to see that, after insisting that Consciousness, Self-Consciousness and Reason are *not* individual *Gestalten*, and can serve only as “middle terms” for individuation, Hegel nevertheless uses this sequence for the periodization of the “biography of God.” As we go through “Natural Religion,” we shall realize that it was “Consciousness” that made it necessary for Hegel to insist that these three “moments” are not themselves *Gestalten* of Absolute Spirit. “Consciousness” cannot be individuated in a single absolute *Gestalt*. Each of the *phases* of Consciousness on its road to the Infinite of Understanding has a distinct religious shape of its own.

After that, however, Self-Consciousness and Reason will each of them mediate a single *Gestalt* through three phases; and Hegel has a surprise (and a small puzzle) for us in each case. It turns out that the absolute *Gestalt* of Self-Consciousness is Art; and the absolute *Gestalt* of Reason is Revelation. These two “shapes” were barely visible on our finite journey—and they come in the reverse order: the Unhappy Consciousness is saved by “revelation,” while the Beautiful Soul has a created artistic vision. But let us look beneath the surface.

Finite self-consciousness begins and ends with the concept of Lordship (absolute self-assertion and absolute subjection respectively). In Religion this sort of “mastery” belongs to the Understanding, not to Art. But what the experience of natural mastery mediates for the finite self is the discovery of the “freedom of thought”; and that freedom is realized not in thought—where it leads only to the consciousness of a transcendent thinker—but in life. The serf enjoys the freedom of an artist, because his fear of the lord obliges him to respect the nature of what he labors on; and in the society of the natural masters, this freedom is enjoyed absolutely by the creative genius who mediates the general consciousness of the immortal community which all mortals “serve.” The freedom of the artist is the infinite complement of the natural servitude that the Stoic thinker recognizes to be universal. Aesthetic freedom is also the comprehensive concept that explains and justifies social servitude. Anyone familiar with Plato and Aristotle knows that their theoretical justification for servitude was the argument that the full development of the essentially human capacity of “reason” requires “leisure” (which involves a release from the bondage of natural needs). Plato reformulated this aristocratic ideal rationally—i.e. he freed it from the naturally given, but accidental, aspect of personal dependence and showed how in a free society the leisure needed for self-making could be universally accessible. It is in his work that the aristocratic ideal receives

the perfect *aesthetic* formulation that Hegel employs; for Plato said that we should think of our lives as “play” not as “work.” But we must “play for the Gods.”²⁶

Hegel avoids the word “Reason” in this paragraph. But he knows that logically we are bound to identify “the unity of consciousness with self-consciousness” as “Reason”; and the oddity of his characterization of “Reason” as “the certainty of being all reality” (pars. 232, 233) is readily accounted for by the recognition that “Reason” in the *Phenomenology* does signify the conceptual unification of “Consciousness” and “Self-Consciousness” (i.e., their reconciliation by double inversion within a more comprehensive Concept).

Just how Hegel’s odd formula for Reason coheres with the tradition of “rationalism,” was already a puzzle for us in our first approach to chapter V. The discovery that the religious correlate of “Reason” is “Revelation” is actually helpful. For God is “revealed” only to the “eye of the mind”; and the “Reason” of the rational tradition is “intellectual vision.” This is the identity that is now, at last, going to be made effective. The “experience of Reason” in chapter V was an experience of defeat. Reason did not recognize itself anywhere in the world of its “certainty.” Even in the *spiritual* encounter of “Faith” with “Insight” (which we have already recognized as the identity of Revelation with Reason), the triumph of the latter was immediately negative. Since “Reason” is the immediate identity of humanity with God, of finite with infinite spirit, of self-consciousness with consciousness, this absolute negativity (of the *finite* self-consciousness) had to be experienced first. Reason has no religion, because it does not know, it cannot know, it logically cannot admit, that it needs one. Only after the bad infinity of the certainty that Reason *is* God has been experienced in every possible way, can the adequate concept of Religion itself be born; for the missing “religion of Reason” is absolute Religion *simpliciter*.

But in this “absolute Religion,” self-conscious Reason and the world of consciousness in which it failed to recognize itself are united in a self-consciousness that is still an object of consciousness, and only a *Vorstellung* of Reason. Absolute religion must pass over into absolute knowledge. The “revelation” of God in the world must turn over into the self-knowing of God in the Spirit. The final self-recognition of Reason, the coincidence of Reason’s certainty with its “truth,” comes when the religious consciousness of the absolute “I” in the “We” passes over into *our* knowledge of the whole world of experience as “Science.” When *our* knowledge becomes logically “absolute,” then at last I, the finite rational self who could find only a hopeless bad infinite quest in the world, can say what Descartes wanted to say: that my certainty of existence (as the thinker who is, alas, always necessarily in doubt) is *God’s* knowledge of himself in the world. Thus there is no “religion of Spirit.” There is only God as Spirit knowing himself in us (as the eternal or logical side of our knowing ourselves in Him).

There is only *one* being in the world who can say “I.” Not even the Absolute revealed in Religion can say it. But the one being who can say it, can say it for God, because that one is a many, a community knowing itself as Reason in its own world. The “personification” of God is the last dialectical illusion of Religion. In reality, there is “I” and there is “We” (all who can, or have, or will, say “I”); and there is

the Spirit that makes the unified science of our communicative interchange possible. The primitive self-certainty of each of us becomes rational (or true and substantial) in the community of the Spirit. Objectively, the Spirit simply is the scientific knowledge of the whole continuum of experience in which that certainty is expressed. Anything “beyond” this, is only beyond it by being an abstraction from it, and hence something “less” than it is.

VII A: Natural Religion

The Absolute Spirit at its first appearance is the absolute “Being,” the “It is,” of which Sense-Certainty was immediately aware. This Spirit is not directly identical with the sensible world (in its transient aspect) because the divine is precisely the unchanging absolute Being that we are intuitively aware of as “behind” that—or as “transcendent.” We know negatively that we do not, and we cannot comprehend this Being. We are aware of it as “Spirit,” precisely because we cannot comprehend our world as a sensible or material whole. We ourselves are comprehended within it, and we recognize that. We cannot yet comprehend it positively, because we do not have the concept of Spirit at all. But we think of our divinity (i.e. we imagine it) as the spiritual Being; and we are not conscious that we are not yet conceiving it as Spirit. Our only actual concept of it, is as an “object”; this is the only way in which we can grasp it as the whole that comprehends us. We do not intend any “degradation” of it, because it is higher than we are, not lower. But logically this degradation of it to pure objectivity, to the negative of self-consciousness, is what has to happen. This pure concept of the absolute Spirit as Being now has to go through the whole evolution of “Consciousness.” Before it can become the creative Logos, the “Word by whom all things were made,” it must generate its own imperfect shapes. The best name for it during this first “substantial” stage (Natural Religion) is the “Divine Life” or Natura naturans.

(d) Religion as Consciousness generally

- 1./684. God is and his community knows him. He is both Spirit and Nature, both self-consciousness and object. From this opposition the determinate shape in which the Spirit appears and is known arises. Our concern is only with that determinacy, since we already know the unshaped Concept [forgiveness]. Religion is neither Nature simply nor Logic simply. Its first determinate shape is spiritually interpreted Being, a thought that is there. Every religion is a self-knowing whole, but also its determining moment belongs to the perfect religion, and *all* moments belong to each religion. God is always thought of as self-conscious, but his being so “thought of” does not make him a “self.” Self-consciousness can only produce its absolute selfhood, and sublate the lower determinations by degrees. Thus what is first thought of as essential, retreats to the sidelines as the comprehension improves. Until that happens it is the higher aspects of the Concept that are present only as images without truth. Thus God’s incarnation is only a myth in the Osiris cult. The Truth of the lower religions is their correspondence with (or “truth *to*”) the actual life of spirit in their culture. We shall only be concerned with what is comprehended properly at each stage.

The long paragraph with which Hegel begins the actual dialectic of Religion opens with a sentence that is deliberately ambiguous: "The spirit that knows Spirit is consciousness of its own self." This is true whether we take it as a Spinozist-logical proposition about what "Spirit" means (a proposition about God), or as a Cartesian-existential proposition about ourselves. It is quite clear that this ambiguity is intentional. It refers us back to the community that knows God as its Spirit. Whichever way we take it (as the "We" or as the "I"), that Spirit is "present to itself in the form of what is objective."²⁷ The first certainty is that "It is"; and it is for itself; it is a self-consciousness. But the self-consciousness that it is, is ours. Only in its own community does it become self-conscious properly. In less developed communities, it is "Spirit," only because it is the absolute consciousness in thought of what the world is known to be.²⁸

At this point a new ambiguity arises. The Beautiful Soul, like Descartes, knows God as the present ground of its own selfhood. When it is reconciled with the other self in forgiveness, it knows this absolute Self as the unifying ground of its community. This is the absolute Spirit that has *appeared*, because we are all aware of it. Its being as self-consciousness is indubitable; but we only have an immediate certainty that it *is*, and that our whole world depends upon it. We still do not know what this means. The "experience" of Religion consists of letting this certainty mean whatever it will—just as we began by letting our finite cognition be whatever it spontaneously took itself to be. Once more, we are beginning with the simplest, most immediately available, interpretation of its "meaning."

Speaking for "us," I say that we (the rational observers) do not yet know what "the being of the self-knowing Spirit in the form of the objective" means. But the religious consciousness of the Broken Hearts is not in this state. It *knows* perfectly well that God is there, and that He is the "Spirit" of their own self-consciousness. Thus, for them, there is a problem built into the claim that "God is," because "being" and "being-self-conscious" are not the same thing. *We* know about this, because we are approaching Religion, with a fully developed "pure Concept" of Religion, and we know that the primitive division in that pure concept is between religious Self-Consciousness, and the Actual Spirit, or the everyday world of Consciousness interpreted in our concept of "Spirit." We can go back to the simplest meaning of "Being" quite easily; but the consciousness of the religious community that we are observing will find in this return, the most severe test of its "forgiveness" that could be imagined.

In large measure, this paragraph repeats in summary the argument about how "Religion" is specified which Hegel has already given (in pars. 677–682). But now he can restate it simply and formally, because all the difficult logic has been done. "Religions" differ in virtue of the phase of consciousness that differentiates each of them. The absolute Spirit is present in all of them, and therefore all of its moments are to be found in each of them. But we can identify each determinate Religion as a singular *Gestalt* in terms of the singular phase of our science of experience that is dominant in it, the phase that determines how all the other moments are present.

This gives rise to a problem of communication. For since every religion expresses

the whole spirit, it is obvious (first) that any outside observer's view of what is dominant or definitive in it, can be challenged by other outsiders; and (further) that any such reductive view is bound to be challenged by insiders, precisely because the experience of consciousness contains many finite standpoints. Insiders are logically bound to disagree with one another (that is one aspect of the reason why the "absolute religion" has to be defined by "forgiveness"). It is fortunate, therefore, that Hegel's concern is really with the exposition of the one religion that fulfils the "science of experience" in its scientific order; it is also fortunate that only one of the non-Christian religions in his survey is still alive (i.e. still has living adherents).²⁹

Hegel's aim is "scientific"; and that means that he is not seeking to "judge" any concrete religion at all. We must take seriously his claim that "the series of distinct religions that will emerge displays . . . only the distinct sides of a single religion, and indeed of *every single* religion." He certainly wants to transform his own religious tradition by displaying all sides of religious experience as moments of it; and by emphasizing the words "*every single*" he is underlining the fact that what he is doing to Lutheran Christianity *can* be done to every religious confession. If any such attempt meets resistance, that will indicate that the resisting party adheres to some specific moment in the series. Among those who are acknowledged to be "Christians" this sort of resistance is bound to come from many "sides" (including the "Lutherans"). Both Hegel's "Religion" and his "Science" are denominationally *neutral*, or *ecumenical* (whichever adjective one's own religious or scientific commitments may lead one to prefer).

"Only, at the same time the diversity must be treated as a diversity of religion," says Hegel. This is where it is fortunate that, except for Christianity, the religions in the series are historic, not alive. For whatever disputes there may be about the adequacy of his characterization of this or that cult, the disputes will remain on the theoretical plane where he wants to insist on the diversity; and for that reason the logical point he wants to make will probably survive the dispute. Thus, we can certainly insist that his image of Greek religion is idealized; and it is surely the case that his image of Zarathustra's religion is oversimplified. But, as far as I can see, these inadequacies do not matter. The moments whose actual diversity he insists on, are needed precisely for the reintegration of our present consciousness. We need to see that they *have* been asserted (by Zarathustra, Aeschylus, Sophocles, Pericles, Plato, to name only some obvious sources) because our poets are asserting them now, and our theologians have traditionally denied some of them.

The "recollection" is Platonic, because the eternal coincidence of past and present is necessarily Platonic. We can only comprehend *our own* time, it is only *now* that we can remember eternity. So if we can demonstrably succeed in remembering the actual past better than Hegel did, it will always be because he showed us how to do it in the first place. He also showed us that it is folly to suppose that we can ever remember the past in the one best possible way. There is *no* "one best possible way." The best possible way is the communally discordant concord of ways in which we do, and we must, actually remember it (as soon as we know what we are doing).

We need to remember the shapes of Religion in their diversity, precisely because their serial ordering brings us finally to this consciousness of the nature of recollection, and to the reconciled knowledge of what our humanity really is. At the beginning, for example, it is important to realize that although “the self” must be there (as it is there, quite certainly, in Sense-Certainty) it is not what is determinative. The most primitive mode of consciousness that recognizes a universal God at all must, by definition, be recognizing a “self.” But if the recognition of the Absolute Self makes the worshipper’s own self unimportant, then the selfhood of the Absolute is unimportant likewise. The divine “Being” is never simply objective, until we arrive at the sophisticated form of Understanding called “materialism.” But primitively, “Being” is an *indifferent* concept.³⁰

“Religion” is neither “Spirit’s way of being as Nature free from thought” (i.e. neither Materialism nor the topic of the Philosophy of Nature), “nor the way in which it is thought free from being-there” (i.e. neither Deism nor the topic of Logic). It is “the being-there that is maintained in thinking, or a thought that is there to itself.” In other words it is the thoughtful awareness of *what absolutely is* or the consciousness of eternal truth as *existing*. If we worship God as “the Light” then we are not worshipping the natural phenomenon which comes and goes (for we know very well that our God maintains us and the earth we walk on); but we recognize the universal spirit as manifest to us in the light, whereas It is obscured in our mortal selves, or in the dark night and the changeable earth. We ought not to say “He,” because we are not referring to a spirit that is like ourselves.³¹ The Spirit of the Light is a power, whose selfhood we cannot conceive at all. What we are (our “self-consciousness”) and what it is (our absolute “consciousness”) differ *toto coelo*. The evolution of “absolute Spirit” is the gradual development of a “Concept” in which these two sides—the finite and the infinite selfhood—coincide in an experience of mutual recognition. As that happens, the concepts which we used earlier to express how God is higher than we are, will “disappear” (or at least retire into a subordinate function comparable to that which they have in the finite world of experience from which we borrowed them). Thus the significance of the Light, for example, will change and deepen; and the gift of our *life* will be recognized as only the outer shell of the more important gift of “Reason.” We shall come to comprehend that Reason is not a “gift” at all; and so on. The important point is that the whole evolution could occur without our ceasing to be “Light-Worshippers.”

As we shall see, when Hegel himself works out the “concentric circle” theory of the Natural Religions, he has to introduce moments on the “lines” of Reason and Spirit that are not found within the “circles” of those moments in the theory of finite experience. The more minimal and general criterion that he states here, represents what he found to be true about the “positive” phases of the Science of Experience (i.e. those that *are* found in the finite “circles”):

If the diverse representations within a single religion do indeed display the whole movement of its forms, then the character of each religion is determined by the particular unity of consciousness and self-consciousness, and that is because the self-

consciousness has grasped the determination of the object in consciousness; it has completely appropriated it through its activity, and knows it as the essential one in contrast to the others.

What this indicates is that the natural determinism of life and its needs is much stronger in the “natural religions.” We find at this level a simple parallelism between Consciousness and Self-Consciousness; and we shall not find in the natural religions the creative scope that is essential for the positive unfolding of Reason, and Spirit. The natural religions are the religions of “substantial” cultures. The worshipping community is not yet aware of itself as a free *Volk*. So the “lines” of Reason and Spirit are only negatively present. The community is on the *minus side* of their axis. It is clear enough that these “barbarian” cultures were not even on the way to the *polis*. So although we can use the stages of Self-Actualizing Reason to articulate their pre-political Spirit, everything will be backwards: God’s “pleasure” will be *primitively* our “necessity” (and so on).³²

In any case, the worshipping self must “produce its own self”—it must *be* Spirit—before it can possibly know what selfhood means in its God. This was the Greek achievement: to know the immortals as a community of selves. Primitively, the certainty of consciousness is just that “It (the Absolute) *is*.” The concept of simple immediate Being is the fundamental determinant. And a community that sees God in this way must see itself in this way. Hegel’s concrete principle for religious interpretation is: “As your self-in-the-world is, so must your God be.” He himself offers here the instance of “death and resurrection” that I gave earlier. The figure of Osiris only represents the recognition that “Death, too, is an absolute *being*,” together with Life; so rebirth (or “Becoming”) is the truth of experience (and of “Being”).

VII A(a): The Light-Essence

The first natural “shape” of God is the universal Daylight. Clearly this identification is influenced by the Mosaic tradition, and by John’s “Light shining in the Darkness.” But the determining factor is the long philosophical tradition in which “light” symbolized the impersonal universality and intuitive immediacy of “rational certainty.” Our interpretation of human cultural history is and must be a comprehension of how we have come to have the Concept of “what is” that we actually do now have. So our interpretation of naïve religion must be guided by the simplest and most immediate image of Reason as we experience it in our present world.

(e) *The Sense-Certainty of the Absolute*

- 2./685. As the “essence” of Self-Consciousness, Spirit is initially a concept without actuality. This is the Night from which all is born; the night of the pure self that penetrates all thought and actuality.

God is implicitly what *we* know Him to be: “the self-conscious Essence that is all truth, and knows all actuality as Himself” (cf. par. 684, first sentence). This is the Concept that begins as a dark blank to be filled in. Consciousness comes, Hegel wants to suggest, out of the thoughtfully active darkness of the still unconscious self. Thus, it is selfhood that is primitive, and consciousness is not to be conceived as a passive reception of external stimuli, or as a causally determined reaction to physical stimuli. Hence the account of the Creation ascribed by tradition to Moses is metaphorically correct. The first of the Mosaic God’s “sayings” was “let there be *light*”; but “in the beginning . . . darkness was upon the face of the waters.”³³

I do not think that this primacy of darkness—or “the night of the self” is acknowledged in the Zend-Avesta, for there the darkness is the kingdom of evil. But it is essential to Hegel’s conception of spirit as self-making; and in this respect he follows and interprets the Judaic tradition.³⁴ His account of Nature-Religion as the first moment of “a single religion,” depends on the presupposition of Yahweh as the “invisible Spirit” that is coming to self-consciousness in the whole story. But he rejects the view that Yahweh is already an independent self-consciousness (because in our experience we can give no meaning to that belief). He cleaves to the Mosaic language of “God speaking,” and insists that God’s speaking is his *being*. The creation of the world is God’s creation of himself, and the *identity* of these opposites is the true essence of God as spirit.

The Judaic tradition would agree readily enough that God (in Himself) is “eternal light.” What the Zend-Avesta adds is that this light is necessarily also external, or “manifest.” The “creative secret . . . has its revelation within itself.” By comprehending light and darkness together within the being of God-in-Himself, the Judaic tradition establishes the concept of Self-Consciousness as Freedom. None of Hegel’s later accounts of the religion of the Zend-Avesta (in the Berlin lectures)³⁵ suggest that he found this unity there. But the Hegelian Concept is an Aristotelian “form”; it *is* the logical drive to manifest itself. This insight is corrupted in the Judaic tradition; it has to be restored from a more naïve source. Yahweh cannot properly come into the *Phenomenology* because he is the invisible Spirit who cannot (by definition) become visible. This is exactly the conception of “Spirit” that Hegel rejects.

- 3./686. As sense-certainty this is a *beholding* of simple being (without contingent accidents). Also, as certainty of self, it is an *absolute mastery*. This “shape of shapelessness” is the light dawning in the darkness (which is its opposite self). Its creative life is like fountains of fire (in which everything is also consumed). Nothing intelligible or beautiful abides; the Absolute is *measureless*, sublime.

Even as the “universal Object,” the absolute Essence is the Ego. That is why it has the subject/object “split” in it. What Hegel has against Yahweh is precisely that (as Fichte’s Absolute Ego) he is not, and he cannot become, a proper self. Whereas, if “consciousness” starts from its sensible “object,” the “self” is logically implicit. The Zend-Avesta offers us the first *dichotomy*, the primitive splitting

of this still unconscious concept of Self-Consciousness. This is the Self-Consciousness that “has itself as pure Ego for object” (par. 173). Hegel is kind enough to tell us directly, that this is the point at which the “lines” of Sense-Certainty and Lordship are first established in the Absolute Spirit. Supposing that there were, already, an actual split between the object and the self, then we, the finite consciousness, would be the serfs of this “Lord,” his property to dispose of at whim. But this Lord is not a Self who owns “things.” The Absolute is just the “shapeless” medium of Light which makes the transient moments of Sense-Certainty visible. Under the aspect of “Reason” it is negative; it is simply the “bad Infinite,” the Boundless or the Sublime.

Also, of course, it is the negative power of Darkness; for as the absolute Lord it is Death. Everything it creates, it also annihilates. In the Lectures of his Berlin years Hegel acknowledges the “ethical” aspect of the religion of Zoroaster, the insistence on a “kingdom of darkness” and an eternal warfare between the two kingdoms. But it seems that in the phenomenological perspective, he regards this as a subordinate moment of the whole, and one which cannot be properly developed without contradicting the defining characteristic of Absolute Being as Sense-Certainty. Logically, the Sunlight needs its “otherness”—and that is acknowledged. It is not equally clear that the Lord needs an “enemy.” That is part of the dialectic of Self-Consciousness; it is not an evident truth of Sense-Certainty. The ethical aspect of the Zend-Avesta—the warfare of Light and Darkness—belongs to its “bad infinite” side. There is no rational resolution or reconciliation for it. So it is drowned in the “splendor” of the Absolute. Ethical “beauty” is “dissolved in sublimity.”

This religion is the “sensible certainty” of the Being of Absolute Spirit (as opposed to ordinary “sense-certainty” which is directed precisely at what is not “spiritual”). Thus the phases picked out on the four “lines” are as follows:

Sense-Certainty (which is the “determining” moment).

Life (see par. 688) as Lordship (or Self-Assertion).

The Bad Infinity of Reason (or the “Measureless”—the “ineffability” of what is absolutely singular and hence “unknowable”).

Glory and Sublimity (Spirit as immediate “certainty,” i.e., “Pleasure and Necessity” raised to infinity).

Notice that at the level of Self-Consciousness only one side of the first concrete “shape” is picked out (Lordship). There is *no* proper Self-Consciousness in this religion, but only the substantial “infinity” of Life, because there is no recognition-relation (not even an unequal one). Under Reason we have to name the opposite poles of the “bad Infinite”; and Hegel himself does not specify the extreme that belongs to finite actuality (the ineffability of what is absolutely “singular”) until the next paragraph. Finally, at the level of Spirit we return simply to the logical character of Sense-Certainty (absolute immediacy).

- 4./687. The content is all a byplay of “examples” for a perception that has nothing to grasp. The infinite attributes of this substance are mere *names* for the One. Nature is its robe, men and spirits are expressions of its glory (without independence).

The “splendor” is a splendor of the heights, without any depths. Thus there is no selfhood in it. We should notice that this strikes at Yahweh, just as much (or more) than it does at Ormuzd. For Yahweh is a “Highest” who does not even need his “height.” There is an even more radical criticism of Yahweh in the point that the “names” of God are infinite. The one “absolute religion” whose eternal validity we are experiencing does not attach any importance to such shibboleths as the *name* of God.

But, of course, there is also a more immediate negative aspect to this sublime indifference. Sense-Certainty is “poor” precisely because language is helpless to express it. God must “speak” not just the infinite wealth of colors in the sunrise, but the nameable colors of the rainbow. We shall eventually return to the infinite naming of God; but God must be named unambiguously, before we can do that in good conscience. For the moment, all finite experience is reduced to meaninglessness by the bad infinity of a “show” without a perceptible (nameable) *essence*. In the loss of all other “selves” the selfhood of God is lost also. He is the “ineffable Substance,” just as we are the (ineffably brief and momentary) “voices of his praise.”

The fact that Hegel is willing to speak of the “perceiving” of this community (and its God), shows that he is quite ready to have *all* of the “circles” of the *Phenomenology* opened out into radial lines—except for the “phase” that is the defining closure of the particular “religious circle” which we are observing at each stage. He does not need to look beyond “Perception” in this instance, because the defining line—the one that is still “circular” because it *contains* everything—is that of “Sense-Certainty.” Under this restriction we cannot transcend the immediate; so at the level of Perception we are already faced with the “bad Infinite.” Even the “names” that are essential for ordinary perceptual language have no determinate sense.

I hope that the meaning of this claim is clear enough. This community of worshippers can, of course, use its perceptual world-view quite efficiently at the finite level. It can identify all the “things” that it needs to. But if someone begins to do “observational *science*” in this community she will be going against the religious spirit of the general consciousness. At what point this will cause a negative reaction is unpredictable; but if it did not eventually cause one, then Rameau’s dream of a peaceful revolution might eventually be realized—and that does seem to be empirically unlikely.³⁶

- 5./688. This revelry of life must determine itself to singular being-for-self and stability. It is in truth the [still unconscious] self, and it must come to know itself. It disperses its unity into an infinity of permanently single forms.

Having just insisted that this God has no proper name, Hegel now gives it the scientific identity that properly belongs to it. As an unconscious Self this Absolute

is “Life.” But inasmuch as Life is essentially embodied, and self-reproductively permanent, this is the inversion, the comprehension of the “result” that we have reached. So it forms the transition to the next phase. We must not suppose that the circle of Life is actually established in the Light-Religion. “Life” properly belongs to the next phase. The adjective “taumelnde” (“revelling”) is significant, however, because it points both backwards to the most elementary definition of “Truth” (par. 47) and forward to the “Bacchic revel” which is the expanded shape in Greek religion of the circle that is just now opening out into a line for us. The “Bacchic revel” is Hegel’s most primitive image of “truth.” In the image, we have the triumph of measure over the “boundlessness” of the Absolute as Light. But we have not come to that revel as a ring-dance yet. Life will present itself first as a simple “struggle for existence.” We are certainly not meant to think of the “measured” aspect of the image at this stage. Hegel is concerned only with the unconscious presence of the “Self,” in that darkness which is the suppressed antithesis of all the “splendor” of the Light-Essence. *Death* is a necessary aspect of this infinite negativity; and it is a fate that the Absolute suffers as well as exacting it. Every manifestation is a “sacrifice” of its boundlessness. The concrete independence of finite existence must be recognized. Natural selfhood must emerge.

VII A(b): Plant and Animal

These names taken from the “kingdoms” of “natural history” are symbolic of two different shapes of human life and culture within the natural environment. It is a mistake to read them as having a “totemic” significance.³⁷ (As we shall see there is nothing in the text to suggest that.) It does look as though Hegel is guilty of arm-chair “speculation” here (i.e., the substitution of theory for observation). But since we know that he wanted to avoid that, we should read what he says in terms of the “experience” which we know that he had.

(f) *The Perception of the Absolute*

- 6./689. The Absolute achieves self-conscious self-perception as the order of tribal societies. Now there are many communities, each with its own God. This is *pantheism*, the One in All. But its unity and peace gives way to conflict, and the warrior-religions must win. From the death of abstraction [in the consuming Light-Essence] life passes to death in action. War and blood-guilt *envelop* [*übergreifen*] innocence and peace. Humanity is divided into separate *species*.

The specificity of natural life is the “absolute shape” of the standpoint of perception. In the absolute flux of Sense-Certainty every nameable thing is swept away. But there are abiding “types” in the flux; and the *living* types secure and guarantee their own constant recurrence. The religious consciousness that recognizes the absoluteness of this perceptibly self-maintaining structure is “pantheism.” But this religion of Perception (at the level of Consciousness) necessarily takes two (*particular* or specific) “shapes” at the level of Self-Consciousness. The

worshipper who identifies with Life universally, and reverences it in all its forms, has a Mother Goddess, and what Hegel calls a “plant-religion.” To understand this we need to know that in Hegel’s natural philosophy the plant-world, or vegetable kingdom, was not completely “specified.” Ideally, any shoot could derive its life from any root; and a single plant (say a plum-tree) could become in this way immortal, without any absolute need for seed-fertilization and reproduction from the seed. Thus anyone who reverences Life as an absolute continuum, and avoids hostility or damage to life as a whole, is a pantheist of the pacifist type. She holds to the “plant-religion.” Such a one will quite appropriately be a vegetarian—as Pythagoras and his school probably were, to name one group with which Hegel was certainly acquainted. All life must feed upon other life; and the Absolute as Life is consciously “self-sacrificing” as Hegel remarked in paragraph 688. But the consumption of plants involves no violation of individuality, precisely because in the vegetable kingdom it is the continuity of life that is dominant. This is the “female type” or the “(self-)intuiting individuality.”³⁸ The adherents of this religion will usually worship the Great Mother; but they *comprehend* “her” as the Tree of Life (or something similar).

In the other particular shape of Self-Consciousness (blind self-assertion) we find the religion of universal hostility to all life except that of one’s own face to face community. This is the religion of Heraclitus in which “War is the father and king of all.” It is the “male type” or the “destroying individuality.”³⁹ Hegel calls this kind of militant tribalism “the animal religion,” not because he is thinking of totemic animals—totemism and aggression do not go together, and many species of animal are non-aggressive—but because the communal consciousness of the tribe is focussed simply upon the maintenance of the tribe as a natural organism. The tribal identity is all that counts, and everything else in the world is merely an instrument for it—or an impediment to be got out of the way.

In this perspective, primitive Judaism is an “animal-religion”; and Yahweh is bound to be a warrior-God precisely because he has chosen just this one “people” for Himself. Yahweh, of course, must not be called a “lion”; but that is the appropriate name for the human leader whom He chooses. The dedication of His people to Him, and his Covenant with them, is the perfect “infinite” or absolute expression for that first moment of natural Self-Consciousness in which the Self has only its empty “independence” for its object; and the promise that Abraham’s seed will “multiply” and “continue forever” is the appropriate “animal” form of self-identity. Hegel no doubt knew of North American Indian tribes whose way of life was founded upon plundering and raiding; but since he is concerned with the historical evolution of the Christian consciousness, it is the warfare between the Jews and their various rivals for the possession of the Promised Land, of which we ought to think first.

The *Gestalt* of the “plant Religion” achieved its fully-developed expression in classical Hinduism as codified in the laws of Manu. But this is *not* what Hegel has in mind here.⁴⁰ In the caste-system the peace and harmony of the “flower-religion” is imposed even on naturally aggressive tribes by the lordship of the Understanding.

This is beyond the level that we have presently reached; and it represents the stabilization of Life's "boundless" revel in a permanently "natural" shape; in other words, it is essentially reactionary.

Hegel is not thinking of the Pythagoreans and Heracleitus either. Not only are they Greeks, but they are philosophical Greeks. Even the "religion of Art" is already, in principle, behind them.⁴¹ Hegel's more primitive vegetarians existed; we behold them idealized in the "noble savage" of much arm-chair anthropology in the eighteenth century. But in the immediate historical context of ancient Palestine they are only a logical postulate. Any peaceable agriculturalists who may have been living in Canaan when the aggressive tribes that Israel fought with arrived on the scene, were necessarily wiped out (at least as a culturally independent community). Hegel needs to postulate the "flower-religion" because that is the "shape" of the Absolute as Perception that must be "recollected" in the "absolute Religion" which we are constructing. If I am right about what Hegel is doing with the "historical experience" of this chapter, then the peaceable agriculturalists of Palestine are the "missing shade of blue" which even a Humean sceptic will allow us to postulate. For the overrunning of unwarlike agriculturalists by more nomadic warrior tribes is a commonplace of early history (and Hegel certainly knew that it had happened in Greece).

There is only this one paragraph about the Religion(s)—universal and specific—of Perception. In paragraph 690 the transition to Understanding occurs. So we must take stock of the lines in this "circle" at once (as well as we can). The pattern seems to be as follows:

Perception (the determining moment)

Life and Struggle to the Death

Observation of Organic Nature

The Law of the Heart and the Frenzy of Self-Conceit

It seems appropriate to find the logical moment of "Observation of Organic Nature" here, because the "self" that we are observing is "animal" rather than rational; these tribes are conscious of "us" and "them," but not of "our common humanity." They are not *actively* rational. And once again it is Self-Actualizing Reason that supplies the place of "Spirit" proper. My interpretation depends on the fact that natural religions can only *symbolize* Spirit. I have allowed myself to be guided by the evident universalism (and intuitive character) of the "Plant-Religion." If we start from "plant-life" as a *symbol* of the universal continuity of Reason, then "animal" must mean "*spiritual* animal"—i.e. a community with its own specialized skills for dealing with a specific natural environment.⁴²

- 7./690. This animal religion of enmity must produce an empire and a religion of subjection to training. Men accept the task of *working* for their God. They express themselves (and Him) in shaping the objective world. This is not yet "self-expression," but the molding of the environment.

The “spiritual animals” (in their *wild*, undomesticated “state of nature”) accept, and adapt themselves to the natural environment. They fight one another about the simple “mastery” of it. The transition to Understanding that Hegel makes in paragraph 690 is a transition to Egypt, the “house of bondage” in our religious tradition. Here, agriculture—the deliberate control and transformation of the environment—began. The Nile Valley was a place where peace was fairly obviously essential for agricultural reasons. But tribal warfare was more or less endemic until the First Kingdom was established; and the Egypt of the Pharaohs still had a pantheon of animal (or half-animal) gods. Since Hegel does believe that the primitive warrior tribes identified themselves with a specific divine animal, his theory of the “animal-religion” is (very probably) an interpretation of the Egyptian evidence that was available to him (mainly in Herodotus and Plutarch).⁴³

The “animal religion” is the absolute *Gestalt* of the “struggle for recognition.” Like the warriors who will not surrender, the spiritual animals are logically bound to wipe each other out. But socially, as well as individually, the lesson of accepting subjection is quickly learned. For the experience of *our* World-Spirit, the paradigm of this was Ancient Egypt.

(g) *The Absolute as Understanding*

In the history of cultural imperialism, what Aristotle claims is true. The Master is the one who knows, and the Slave is simply a tool, an animate thing. The transition from the Life and Death Struggle to Lordship and Bondage takes place in the council chamber, rather than on the battlefield. There is a fascinating example of “double inversion” behind Hegel’s claim that it is “die Arbeitende” (the laboring consciousness) that “holds the upper hand over the merely rending animal spirits.” For in the world of Plant and Animal it is certainly the plant-religionists who are “laborers”; and they must inevitably be the underdogs.⁴⁴ But when an Egyptian “lord” manages a great estate, he identifies not with the fighting but with the laboring consciousness (though he neither fights nor labors but only controls those who do both). In *this* way, the “laboring consciousness” comes to have the “upper hand.”

What happens when the imperial right of the Understanding is established, is that the warring tribes are persuaded to labor (with the example of some recalcitrant groups who were exterminated to the last man before their eyes). I call this radical fear of the social lords “persuasion,” because the certainty that the disobedient will die, is reinforced by the religious belief that they deserve to. What produces obedient behavior is the general conviction that “the Gods” do not want us to fight our ancestral foes during every moment when we are not planting and harvesting; *the Gods* (not just Pharaoh) want us to build the Pyramids instead. This ideological manipulation is what Hegel calls the “not merely negative [i.e. life-threatening] but tranquillized and positive action” of the new controller.

When God first appeared as “Lord” (in the “Light-Essence”) his worshippers were simply transient ministers. That was not really Lordship and Serfdom, but only Universal Lordship, or the first relation of the Changeable to the Unchangeable

in the Unhappy Consciousness. In logical terms it is the simple self-assertion of the Ego (par. 173). The full realization of Lordship and Bondage requires the development of the relationship of unequal recognition in society. There must be a Master Class in the community (not just an absolute despot both in the Sunrise and in Susa); and the ruling class must be distinguished by the possession of understanding (not just military honor).

There was a caste-system in Ancient Egypt; and since his Greek sources knew this, Hegel knew it too. The imposition of social castes upon human “nature” is the “reduction of the *Ansich* to a determinateness.” The *Ansich* is the primitive self-assertion of the Ego; the determinateness is the “spiritual animal shape” in which the tribe recognizes itself when it accepts its caste-status as defined by the priests. The Egyptian pantheon included *craft*-gods. For example Thoth, the god of the scribes, was an ape.⁴⁵ Hegel regards the mingling of the human with the animal shape in the God, as the sign of the transition from aggressive Lordship to the intellectual mastery of the Understanding. We must remember that the Understanding was not primitively identified as exclusively human. The social insects, especially, have been seen as paradigms of it. We find Hegel himself appealing to them in paragraph 691.⁴⁶

The caste-system is the primitive (or natural) shape of what will become Culture in the self-making of free Spirit. But in the Christian context of human recognition Culture is the *voluntary* remaking of the self in the service of God. In the “natural” shape of Culture the sublated self of the warrior tribes is brought into subjection and disciplined into a “made thing” (the craft-skill). The primitively assertive selfhood is “worn down” and a “common actuality” is left (instead of the immediate identity of self and world that will go to the death in resistance). The (intellectually) “laboring self”—as the concrete or commanding “being-for-self” to which this “determinately reduced in-itself” is made subject in the new “antithesis” of Lordship and Servitude—is now Lord over the “worn down” self.

But the discipline and training of the subject self is not all that the lordly Understanding produces. “It also produces its own *Vorstellung*, its being-for-self spelled out [*herausgesetzte*] into the form of an object.” Agriculture, and made homes of some sort, can belong to the naturally given human tribal group; but now the human community has Pyramids, temples and planned towns. The human Spirit is beginning to create its own environment, instead of simply adapting to Nature as given (like the lower animals).

VII A(c): The Master-Craftsman

Hegel delays the heading that marks the transition to the Religion of Understanding Consciousness until after he has actually made the transition in his discussion. So there is no need for a preparatory survey here. We already know that the World-Spirit is in Ancient Egypt. Our textual commentary can continue without a break.

The image of the *Werkmeister* comes, most obviously, from Plato's *Timaeus*.⁴⁷ By insisting on the trained, repetitive, conditioned reflex character of craftsmanship (the ape-god of the scribe is a very apt symbol here) Hegel is driving home the fact that the craftsman is not "creative" like an artist. When we begin to create ideal images of ourselves, and for ourselves, then we are artists. But the Understanding accepts its problems, as well as its material, from nature. It thinks in its own mathematically abstractive way, but it has not grasped the thought of what this free activity is. It is Reason in the service of Life as Instinct. We can call it the "instinct of Reason" because it meets natural needs and satisfies natural desires; and it adds its own concerns onto that. In that perspective its theoretical activities are like the geometrical work of the bees.

The metaphor of the bees is a mythical *Vorstellung*. We must read it spiritually. It is important to grasp the implication that "In the beginning was the Deed." Reason must begin "instinctively" because Spirit can only *know* what it has already made or done.

- 9./692. Craftsmanship uses the abstractions of Understanding to create geometric forms. These forms receive only the departed spirit, and are related to Spirit only as the Light Essence that is the fount of Nature.

The Understanding is essentially the power of abstraction from Life. Only the geometry of cell-construction provides a bridge between it and the instinctive behavior of the social insects. The love of Geometry which Plato ascribed to God is the "instinctive" form of Reason, because the most primitive impulse of Reason is a reaction against the free "revel" of life, a reaction back towards the reliable predictability of the inorganic order. The Understanding arranges even living forms in a "logical" order; and it deals with them only as abstract universal "essences." It is not surprising, therefore, that the Religion of Understanding is a religion of the grave and of death, a religion of the darkness of the inorganic world to which the finite spirit returns. The recognition and acceptance of *mortality* as a logical moment of Life, is the "beginning of Wisdom."

We have already seen how the sublation of the spirit of aggressive self-assertion and independence in this new culture takes place. The religion of the Craftsman is the Absolute expression of Lordship and Bondage. The Spirit is present, but it has to labor on "Lord Nature's" property. It is now "making itself" but only in an unreflective way—the very way in which the artisan-serf "makes himself." Reflectively the serf sees human freedom in the Lord; but he is unreflectively bringing the more truly human freedom of the artist into being.

There is a similar pattern in the relation of the human community to its God. The society of the imperialist Understanding still worships the "absolute freedom" of the Light-Essence—identified now as the actual Sun. But in its conscious subjection to this Divine Lord, this society is creating a distinctively human form of freedom. The cult of night, darkness and death is a simple inversion of the "daylight" of the intuitive intellect. Darkness and death were already essential and

universal moments of the Light-Essence (just as Non-being is equal with Being in Sense-Certainty). But the Absolute Spirit is now alienated from the manifestation of its “glory.” The physical world is Spirit’s “handiwork”; and the Creator is beyond it. God is no longer in the world at all. The world is a system of symbols that point towards Him. This society puts all of its disposable energy into building the King’s tomb, because the dead King is its representative—its mediator—in the world beyond. The Sun-God, Ra, is its supreme God; and we have a permanently instituted Kingship that speaks to God and for him, instead of the momentary theophany of the messenger, Zarathustra. In this way Natural Religion is brought round into its own perfect circle, bounded by the human understanding. But what the “external connection” between the House of the Dead and the Sunrise is, we have still to be told.

- 10./693. The laboring spirit has objectified the difference between raw material and self-conscious work. Now it must reconcile body and soul in a unity. In the first step the laborer begins to know himself in his work. But Spirit itself has not yet appeared. The laboring spirit is its bondsman; thus only the alienated image of the soul molding the body is present.

The ruling class of this society constitute the “(intellectually) laboring spirit.” They know that human life is to be organized as “laboring for the Gods”; and they have so organized it. The *Trennung* involved in craft-labor between the forming activity of the craftsman, and the raw material that becomes the formed craft-object, is objectively present in their consciousness, because they themselves have labored to form human society as a system of craft-guilds. That formed society is now in full operation producing the “goods” that life needs. “Soul” and “body” are now visible, in their “understandable” relation: the body is the *instrument* of the soul. This relation is *absolute*, since the soul will still need its body in the afterlife.

But this relation of external utility is not the fully rational relation of soul and body. “External teleology” is not the “truth” of Reason or even of self-conscious Life. It is only the relationship established by the rational intuition that *instinctively* recognizes itself as a living system of instincts which is the means to its own end. Spirit has to “come closer to itself,” in the sense of adopting an “internal” standpoint. We know this already, but the Spirit we are observing simply learns by experience that the relation of Self-Consciousness to Life is not this relation of “utility.” At the finite level, the serf discovers a new sort of freedom in his “self-culture”; and this is what happens to the “serving society” in its relation to the Gods. But for the explicit consciousness of this community, the Gods as Immortals are “beyond”; only their bodies are here in the Temples (made by us humans). Human life is just a “husk” for the “represented” spirit in the Beyond. We are on our way to the realm of Light, and we can go to the Beyond.

The next stage of consciousness is implicit in the fact that only beings with bodies like ours can do what we do. Our bodies are what we work with; and socially speaking, the great order of Nature is only the body that we work on. The Gods must come to our world therefore, and be with us. It is our shape that they must

have (at least partly), because as we work to utilize the universal forces of Nature we recognize that our own intelligence is the most important of these forces.

This seems to be how Hegel conceives the social experience of the “sides of singularity and universality coming closer in the work” even as “the work comes closer to the self.” The laboring society does not think of the Gods in their universal essence as being “like itself.” But as it makes their singular bodies they come closer to it because the “sides of thought and being” come closer to one another in the work. When we make bodies for the Gods, they must be at least enough like us to be able to make things too, since they made the world. This shows up “instinctively” in our making of them.

In commenting on paragraph 691 I said that we can call this phase “the instinct of Reason” and spoke of its “mathematically abstractive thinking.” But this language must be interpreted with great caution. At this stage “the instinct of Reason” is properly “practical Reason operating instinctively as Understanding” in and upon the natural world; there is all the difference in the world between the engineering mathematics of the Master-Craftsman and the truly abstract mathematical thinking of Descartes. The Egyptian society is properly the world of “instinctive *Understanding*.” It does only “applied mathematics”; its “geometry” really is “land-measurement.” It cannot divorce the “soul” of the mathematics from the body that is measured and molded. Before these Egyptian mathematicians could do “pure mathematics” they would have to come to a clear *intuitive* awareness of their own “thinking” capacity. That is what they are still stumbling towards. It is in the religious experience of making images of the Gods that they begin to discover what it means to call man “the rational animal”; and they make that discovery only by observing what they have done.

We can now identify the moments determined by this Religion as follows:

Understanding (natural or unselfconscious)

Lordship and Bondage (as alienated worlds of Spirit and Nature or soul and body)

Physiognomy and Phrenology (external relation of soul and body)

(The immediate identity of) Virtue and the Way of the World

As far as its manifest side is concerned, the Egyptian Religion repeats the experience of labor as “formative activity” exactly. The principle of intellectual alienation is maintained. What the religious craftsman makes is only a *symbol* of the Infinite: a statue in its own temple. The intuitive assumption is that soul and body are as separate as the intellect and its raw material. But the labor is actually embodied in the symbol made; and the maker (as the representative self-consciousness of his community) is directly conscious that he has made this symbol of the divine.

- 11./694. Now the house [temple] begins to be adorned with plant images. The shapes are abstracted and geometrized; but also the geometry becomes organic, curvilinear. The “root” of free architecture is present.

Nothing is needed here, I think, except to give a “historical materialist” translation of what this experience reflects on the side of its “actuality,” and to expand a little on what Hegel himself says. In real life, the vegetarians have become agricultural serfs, and beasts of burden for the building of monuments; and the animal-aggressors have become trained craftsmen of all kinds (and an army). But in the Religion of Understanding all of the living objects revered in the religion of Plant and Animal become dead stone symbols. The permanence of the stone is an engineered material expression of the “eternity” of all “abstract ideas.” This realizes the Concept of the natural Self-Consciousness in its instrumental relation to the world of Consciousness perfectly. Everything is a tool or an ornament, nothing has its own essence. But at least round shapes come into their own in this way; and Hegel sees in this the beginning of the transition to the intuitive Reason of the freely creative artist. In his mature view architecture is the “symbolic” art.

- 12./695. The temple now has a God-shape in it. This is first an animal shape (the shape of primitive independent life), but the laborer puts himself in too, so the animal head is now a thought-symbol. The God-statue does not speak, however. Its only word is a natural noise (associated with the dawning sun).

Already in paragraph 694 Hegel was beginning to explain what he meant by “the work coming closer to the laboring self-consciousness” as its “sides come closer to one another.” But this is where he explains it fully; and at the same time he explains the “external relation” to the Daylight mentioned in paragraph 692.

In the temple there is a statue of the God (or statues of the Gods). This brings the divine self closer to the human self than before. It looks rather as if Hegel believed that the Pyramids and the cult of the dead were older than the temples and the visible gods in Egyptian religion. If so, he was (I think) mistaken; but the point is interesting, in principle, because this makes the Egyptian cult the first one to which he has ascribed any evolution: he sees the return of Light and of Plant and Animal into the higher concept of the Supersensible Beyond as a gradual process (corresponding to the actual evolution of society in the Nile valley).

In any case, just as the plant-world is reduced to instrumental status, so the lordship of the Understanding over the different natural talents of human beings is symbolized by the combination of human and animal shapes in the statues. The Egyptian statue is a “hieroglyph,” says Hegel. This directs our attention to the most important achievement of the symbolic culture: the invention of writing. In 1807, no one could read the hieroglyphic script; but scholars understood quite well what it was. Ever since Herodotus, indeed, the Greeks had known that there were several forms of hieroglyphic; and they knew something about what the different scripts were for.

The statue, however, does not do what a truly self-conscious Absolute Spirit must do: it does not speak. The dominance of the Understanding is symbolized by the partially human form of the statue; but the non-human aspect of the “matter” upon which the Understanding must work—the naturally given character of physical and instinctual needs that are pre-linguistic—is symbolized equally clearly by

the animal shape. The Understanding speaks; it formulates and solves problems in a conceptual mode of consciousness which is distinctively human. But this problem-solving is not yet the creation of a human world, a human reality, or a second nature whose very being is linguistic, because it rests on laws and customs that are consciously made by the community, and formulated in their daily speech. In the Egyptian world, the Gods and men need different scripts.⁴⁸

It is obvious that social custom, formulated where needed in speech, is essential to the existence of any community of human animals. Shared customs are presupposed by the recognition of the "Light-Essence." But the conscious establishment of custom and law, is not yet recognized as the foundation of our distinctively "human" mode of existence. In the world of Natural Religion, the human community solves problems and remodels its environment; but it has no consciousness of making *itself* by so doing. That sort of consciousness can only arise when there is a *community of communities that do things differently*, and a communication system in which all parties recognize both the legitimacy of this, and the "freedom" that is involved in it. In that world, the statues will somehow have to say what the differing communities need to hear about themselves. For the present, it is enough if the one community has a supreme human shape. Since that shape is a God of Nature, it can make, or be somehow associated with, any sort of natural noise; and its divine utterance can then be interpreted by the priests in any way they wish. The Sun is the supreme manifestation of the universal power of nature; so if a statue can be made to "speak" at sunrise, that will indubitably be the "voice of God."

Hegel is relying here on the account of the colossal statue of Memnon at Thebes given by Strabo and Pausanias.⁴⁹ The statue "spoke"—that is to say, a noise came from hollow channels inside it—at sunrise (or soon after). Hence it was Ra, the Sun God, who spoke through it. But the sound that it made was not human. It was a meaningless noise like the cry of an animal; the outward shape of the self without its inner meaning.

- 13./696. The consciousness of the living organism stands in contrast to this outward selfhood. Inside the statue there is only formless blackness.

Hegel (in common with many romantic intellectuals among his contemporaries) regarded Egyptian culture as an expression of the "riddle of existence." But since he does not himself believe that "life is a riddle," he sees the Egyptian "riddle" as arising from the structure of the Understanding, which can give only a "lifeless" answer to the "riddle of life." The true answer to the "riddle of the Sphinx" is the one given in the Greek Myth: "Man." But the Understanding can only make a *stone* man. Thus the Egyptians could recognize that one divine life was expressing itself in the infinite freedom and variety of living nature; and they "understood" that "selfhood" was the true meaning of this great display. But they had only a mechanical conception of the self. So they could only represent the *outer* selfhood of the Absolute. The utilitarian instinct of Life itself "downgrades" both its own physical inward complexity (the "inner of the outer"—pars. 286ff.),

and its bewildering outward variety, to a mere “housing.” Inside the statue there is neither a physical organism, nor a conscious self. There is only “black formless stone.”⁵⁰ This represents the *enigmatic* river that “cares not what mills it drives” (par. 285). “Natural Religion” at the extreme of its reach can portray symbolically what “natural philosophy” discovers.

- 14./697. The self (represented both ways) as inner and as outer must come together. The soul of the statue that man has made must come forth and speak; and the inwardness of nature in its many forms must express its unity. This is symbolized by the Sphinx (whose *head* is human); and by the oracle whose speech is deep and hard to understand.

Both the *Darstellung* of Spirit in nature, and that offered by the statue, involve the moments of the “inner” and the “outer”; and they display them antithetically. In Nature it is the “inner” that is “selfhood,” and the “outer” is just *Dasein*; whereas the statue is inwardly just *Dasein*, and outwardly “the Self.” As Hegel says, “Both displays contain *inwardness* and *thereness*—the two moments of the Spirit.” Both displays represent Life as the “riddle of the Sphinx.”

The statue has the outward shape of the human self; and that shape points symbolically to the selfhood of the Absolute Spirit in the darkness of the Beyond. But this symbolic inwardness is not humanly expressed. It does not emerge as articulate speech, the *Dasein* of the Spirit itself. On the other hand, the spirit of Life which animates the whole range of organic forms is present in stone here and now on Earth, and not in any noumenal Beyond. But it is silent likewise.

The outward shape of organic life is “multiform.” So the “universality” of Nature dominated by the Understanding must be represented by a blending of human and animal shape. Both elements are symbolic. The human shape represents the Understanding and the animal shapes represent the tribes and crafts in bondage. But the result is a question, not an answer. Consciousness is wrestling with its unconscious living embodiment; the inward simplicity of the abstract intellect is trying to comprehend the concrete multiplicity of things. There is no “inner light”; but everything in the ordinary daylight is well organized. The only voice of the Absolute is that of the Oracle (which offers a wisdom that ordinary mortals cannot understand).

- 15./698. At this point the instinctive labor of self-consciousness concludes. The craftsman has worked himself up to the point where his self-consciousness divides, and spirit meets spirit. His statue-monsters now assume spiritual shape: an outer [the human body] that is alive and conscious [“gone into itself”], and an inner [human Reason] that utters itself. Spirit is Artist.

When the statue achieves human shape (or the Sphinx just a human head), the “instinctive” work of the community’s self-consciousness comes to an end. For the human craftsman (the finite Spirit) is now face to face with an Absolute Spirit which, by the clear logical implication of the symbol, can speak. In Egypt the

image may itself be a riddle, and the divine speech may be oracular and esoteric. But the Beyond, where all will be known, is only just across the water. In the *Greek* Thebes we meet the hero who will purge away the animal form of the Theban Sphinx of Egypt.

The solution of the riddle is there before our eyes. The God's shape tells us that she thinks, just as we do. Why should her language not be ours? She does not have a dog's head now, or the head of an ape. So her language ought to be ours. Alongside the sculptor there must stand someone who knows how to express our communal thoughts as thoughts. We must be able to recognize that our mediator is not interpreting the riddle of a higher "divine" tongue, but saying what we all know about our own universal essence, and about our own relation as mortals to what is immortal. The stone symbolizes the perpetuity of Absolute Spirit. But by giving it a human form, the sculptor has expressed the clear consciousness that it is our Spirit. He has made its bodily shape. A craftsman of a new kind must now make its human voice. The immortal spirit must speak to us not with natural noises but in our own speech; and what she tells us we must be able to recognize as what we all knew or ought to have known. Her utterance must be recognizably divine because it is the voice of Reason.

Notes

1. See *A Pluralistic Universe* (1909), chapter III (London, Longmans Green, 85–129).
2. Compare Rosenkranz, 192 (Harris and Knox, 265). T. Adorno claims that Hegel uses the theory of the communal *Geist* to "confer legality on the rule of force over individuals" (1973, 338). G. Lukács, on the other hand, says that Hegel "as good as never troubled himself with the religious need as such" (1978, 57). Both authors are seriously mistaken. Hegel uses the concept of the communal *Geist* to *explain why* "the rule of force over individuals" has legitimacy (or can appear to have it even to the individuals themselves, e.g. Antigone). His own interpretation of "the religious need as such" can be seen in paragraphs 656–671 above; and the "Napoleonic" indifference of *his philosophy* towards religion (about which Lukács is more nearly correct [1978, 58ff]) is exactly what makes his analysis into the best foundation for the *criticism* of "the rule of force" when it seeks to legitimate itself by appeal to the communal *Geist*. (This last point is well grasped and applied by H. Brod, 1992, 123–124.)
3. We should certainly denounce the judicial execution of an offender against this crazy edict as outrageous tyranny, but at that point we should shift the "crazy" label to the side of the supposed offender.
4. Compare Rosenkranz, 135 (Harris and Knox, 180) and 159 (Waszek, 1987, 254). These texts belong to the early Jena years, but the ethical concept of "fate" was formulated in 1797 or 1798 at Frankfurt. The development of Hegel's concept of Religion (and especially of God) during the Jena years is ably expounded by H. Kimmerle (1984).
5. As many interpreters have insisted (e.g. G. van Riet, 1967, 13; M. Westphal, 1978, 195ff.; A. K. Min, 1974) "God" is not originally an invention or projection, God (or the Gods) is an intuitive "concept" that articulates our sense of *what is* as a totality or a whole. "She" (or It or They) evolves as our interpretive concept evolves. We become conscious of

“projection” when we recognize that “She” (or “They”) is “like us” because our interpretive activity is an essential moment in the “whole.” The “whole” is always there as an object of experience. But it is only “there” in the way in which it is experienced. So, to say (as Kroner does [1961, II, 403]) that “Finite spirit becomes more and more conscious of its identity with absolute spirit” is only to say that as the concept of the whole evolves, the community becomes ever more clearly aware about its “absolute” role and status in that concept. As long as we think that “absolute spirit” is *causing* the advance (in some independent way) we have not reached the truly “absolute” concept of it. The “order of Nature” (or the “Infinite” of Understanding) is the “order of causes.” God as a “liberated” (or personalized) *Vorstellung* of the “Author of Nature” is what is eventually recognized as a “projection.” What is *truly* “absolute” is (by definition) *beyond* “causing” anything (except in a *logical* sense).

6. Compare the famous passage at the end of the *Critique of Practical Reason*.

7. The “speculative” interpretation of the Incarnation does involve this heresy. Hegel interprets the Earth as the real “body” of the Incarnate Logos in the Triangle Fragment (of 1802?). See *Hegel-Studien* X, 1975, 133–135; *Toward the Sunlight*, 184–188. But Lauer (1976, 122n.) is mistaken if this is the “burlesque of Christian religion” that he claims to find in paragraph 220. The Unhappy Consciousness does not “think” in this speculative sense; it must learn to think “critically” first. It simply *sees* the miracle of “the shaped Unchangeable” and consumes its symbolic share of that shape. (See further the commentary on par. 220 in *Pilgrimage*.)

8. One might be tempted to think that because of this opposition, the great rationalists cannot properly be regarded as paradigms of “Reason.” But it seems to me sounder to infer that Hegel means to deny the name of “religion” to their rational theology. In other words, Hegel agrees with Pascal about Descartes; and the universal condemnation of Spinoza as a “notorious atheist” certainly confirms Hegel’s logical analysis of how Reason “appeared.” The Leibnizian “best of all possible worlds,” was attacked from the side of Enlightenment, rather than from that of Faith. The *Theodicy* of Leibniz is the mature shape of the “religion of Reason.” I shall leave it to the reader to decide whether Hegel was right to side with Voltaire in regarding it as a joke. It certainly is the “perfect” conceptual embodiment of the formal *Sache selbst*.

9. D. P. Jamros (1994, 53–54) has noted that the religion of the Underworld in True Spirit is the first form of what Hegel calls “Faith.”

10. We all know that Hegel insisted that philosophy is not concerned with the future because the future is not “actual.” In this shape the Greek “reverence for fate” survives in his interpretation. So when he bases his interpretation of World History on the Christian metaphor of “Providence,” he is implying only that Philosophy *is* concerned with the future (as “real possibility”) in its “eternal” aspect, i.e. categorically. In our science of experience we know as much about the future as a mind in the “eternal beyond” could ever know (if the “eternal beyond” were an intelligible concept of “eternity” at all). In the perspective of “philosophical history” Providence becomes “the cunning of Reason.” The absolute contingency of the (Greek) future as future is united with the philosophical comprehension of the “providential” future as what *will be* comprehensively known. Thus, to my eye “the cunning of Reason” appears to be more Greek than Christian. (Another way of putting this is to say that the supposition of a “Divine Mind” that *really* knows “the future” is absurd. All of the Christian theology of Predestination rests upon a philosophical confusion.)

11. When we call Conscience “Reason” here, the proper reference is to the singular finite shape of Reason; to regard Conscience as a shape of singular Reason will help us to grasp

this chapter on Religion as the realization of “Reason” in its *substantial* reality. “Conscience” is, of course, a *world*, for it cannot exist except as a community of “equal recognition.” But in that aspect it *concretizes* the still dialectical community of the “Real Individuals.”

12. The whole *evolution* of Conscience, from heteronomous “obedience to God,” through “self-enclosed autonomy” to broken-hearted reconciliation, is the religious “element.” (We must not think that it only becomes a “universal element” when it breaks “open”; Antigone’s position appears “conscientious” to Goethe, not just because she is “autonomous” but because she is universally “reconciled.”)

13. P. Ricoeur (1982, 86) rightly says that Hegel’s philosophical thinking “does not abolish, but legitimates all the shapes that lead to this ultimate stage.”

14. If we insist that it is a plausible interpretation of certain German mystics, both Catholic and Protestant, we must still confess that it is plainly *heretical*; and that since the greatest of those mystics (Eckhart, Boehme) were *not* heretics in intent, Hegel’s “manifest religion” is not what they intended. This is very clear in the case of Boehme.

15. “A God who produces himself from all eternity” was Goethe’s ideal; and through him it influenced many Romantic thinkers. See *Dichtung und Wahrheit* at the end of Book 8 (*Werke* 13:379; *Collected Works*, Princeton, 4:261–2).

16. God dies, in order to be resurrected as Spirit, so no simple-minded atheism can be founded upon this way of expressing the circular pattern of chapter VII. But it is no accident that “absolute Knowledge” closes with the image of Calvary. (Also, we may note in passing that those who insist, correctly, that Creon is not Antigone’s *moral* equal, have lost hold of the Absolute that should be with them if they think that this inequality is philosophically important.)

17. For the evolution of “Consciousness” itself our experience is contemporary rather than historical; for instance “Sense-Certainty” becomes a philosophical position in the Enlightenment (par. 558).

18. It might seem that Hegel’s project will come to grief on the difficulty that there can be a differential evolution of the “phases”—e.g. a religion of Perception that is *more* “rational” and one that is *less*. But in fact all such “judgments of quantity” must fall away, both because they are necessarily subjective in specific cases, and because the Religion of any culture is bound to be exemplified in a whole range of “degrees.”

19. All “shapes” of Religion are shapes of Absolute Spirit. But the “shape of Consciousness” that is “determined to singularity” by the concept of Spirit itself as “middle,” is plainly “Absolute Knowing.” So there are only three “conceptual middles” in the Religion chapter. Each middle has three “phases.” So there are nine “shapes of Religion” (three natural, three aesthetic, and three “manifest”). In Natural Religion and Art-Religion the Shapes are clearly indicated: first three separately, then three together. In the Manifest Religion they are both separate (phases of development) and together (as moments of the community’s present religious life).

20. I am deliberately leaving out the *Gestalten* of “objective Spirit” because the instantiation of these is peculiar; the “Art-Religion” is the first one that “grabs up” a distinguishable phase of “actual Spirit.” The earlier moments of “Spirit *coming* to actuality” must be looked for in chapter V (under “Self-Actualizing Reason”).

21. Rosenkranz, 135 (1802?); Harris and Knox, 180 (in the language of Hegel’s Incarnation Theology this ineluctable character of “Fate” is the “infinite grief”).

22. In this paragraph Hegel affirms with absolute explicitness that the *Gestalten* of chapters I–VI form *one sequence* (*Eine Reihe*). So what Kenneth Westphal says (1989, 134) about “the erroneous supposition that there is one single, cumulative development plotted in the *Phenomenology*” is itself erroneous. But it is not clear what *error* he has in mind, since he clearly recognizes that there is a linear methodical (or logical) progression in the book (1989, 156–157). It seems to me probable that he has not attended carefully enough to the distinction between the “one string” (which ought to unite chapters I–VI serially) and the circles of cultural development in time which form themselves when that string is cut at the “knots.” But it must be acknowledged, in his favor, that the methodical transitions at the major knots (the transition from Consciousness to Self-Consciousness, etc.) are different from those made at the minor knots (from Sense-Certainty to Perception, etc.). He and I are certainly united in our opposition to those who want to “hitchhike on the highway of despair”—not to speak of the completely “unscientific” interpreters who treat the *Phenomenology* as a collection of loosely related fragments.

23. Hegel says that the one line (of our science) must become “many lines” (at least the *four* unknown “strings” of Consciousness, Self-Consciousness, Reason and Spirit) because he is thinking primarily of the absolute Religion, which comprehends all of its historic phases in an ever expanding way. Thus his point about “the coordinating of directions” is that the phenomenological line of advance which leaves the earlier modes behind it, must now turn into an ever expanding system of circles in which *all* of the moments *grow* with the arising of each new circle. The “one line was itself a line of *circles*. These circles are now untied; and they become radial lines for a series of new circles whose actual radius is determined by the particular “phase” that controls all of the radial lines at the given stage. (We shall see later that for the metaphor to work, the *line* of “Spirit” has to originate where the *Volk* is introduced in chapter V.)

This is how “each particular moment takes and receives into itself in common the identical determination of the whole.” But Hegel’s final warning that the spatial metaphor is not meant literally is important. There will in the end be a religion that comprehends every shape of consciousness (every one of the little circles becomes a radial line in it). But the “shapes” are all transformed in the process of their opening out. Hyperion’s Sunrise (or Wordsworth’s) differs from that of the ancient Parsee, because the God it reveals has a *known* identity which involves the readers themselves. As an “experience” we can call it *both* “deeper” and “shallower.”

24. We shall confine ourselves to the *Christian* communion, because that is the only one recognizable as complete in the evolution of “actual Spirit” so far; but this perfected communion is not denominational, and it is in principle ecumenical, since it has to be reconciled with its “atheist” critics. This transcending of its denominationally “Christian” character by the “absolute religion” transforms our conception of the *systematic* “philosophy of religion” that Hegel left us. Those who maintain the trivially correct thesis that Hegel gives us a logical “typology” of religions (e.g. Schmitz, Jaeschke) typically comment that Hegel “fails to appreciate the degree of inwardness present in such religions as that of Israel, Islam and Catholic Christianity” (Schmitz, 1970, 733). Once we recognize that the typology is determined by the need to array religions in a sequence of phenomenological development, it becomes apparent that with the arrival of the “absolute” religion, all such “comparative” judgments—including Hegel’s own—are logically mistaken. Logical development has no necessary connection either with moral advance, or with subjective inwardness (or “depth”). For this reason, too, efforts to *improve* the logical sequence by supplying “better” religions

than those which *history* gave to Hegel (as in D. E. Christensen, 1970) are misguided. See further H. S. Harris (1991).

25. This paragraph seems to provide the firmest foundation for the Neoplatonic reading of the *Phenomenology* given by Hinrichs—see E. von der Luft (1989). But my approach is from the opposite extreme (sensible experience).

26. See especially *Laws* I, 644d–645c.

27. It seems to me that enlightened “Christian” interpreters like P.-J. Labarrière misrepresent “natural religion” by using language that evokes the “projective” views of such modern materialists as Freud. Thus Labarrière (1968, 166) says that “In natural religion . . . the spirit contemplates itself in the immediate unity of its Self with the being-there that it invests with its presence.” If we think of some tribesman reverencing his totem, this appears to be a neutral way to talk. But if we think of Hegel’s contemporaries, Wordsworth and Hölderlin, it becomes obvious that the expression “invests with its presence” is prejudicial. “Nature” reveals itself to these rational worshippers *as* the “divine life.” It enfolds and encompasses them because they are part of “Nature.” This is a “returned” shape of “natural religion.” But it is the sort of model that we need.

28. The concept formed by this still undeveloped absolute consciousness is quite “true”; so it is “knowledge,” but it is not yet complete or adequate.

29. The Parsis survive as a small part of the great panorama of religious experience in India. But their experience has been transformed by that fact; so there is no need to apply anything that Hegel says about the religion of the “Light-Essence” as an independent cultural phenomenon to them. Hegel certainly knew by the 1820’s that they existed (cf. *Vorlesungen* IV, 257; Hodgson, II, 355 [1824]). But it is clear that he did not mean to refer to them here.

30. That is why the object of Unhappy Consciousness is called “the Unchangeable.” The actual self-consciousness is aware of selfhood as essentially changeable; and even in its reconciled state, it cannot *experience* reconciliation, because true Being remains eternally unchanged.

31. The use of “He” indicates a patriarchal-authoritarian structure in the *actual* community; for that is what makes “He” the natural way to express “superiority.” But if the “life-giving” aspect of the divine power is identified as the ground of the “superiority” then “She” becomes more natural. Hegel put that in second place (which is right for the world that he wants to comprehend). But “It” is the *logical* word.

32. Hegel may have been enough of a dogmatist (in the manner of Aristotle) to believe that the *polis* was the only rational way forward. This is certainly the impression given by his later efforts at a “systematic” philosophy of religion. But equally certainly this “naturalism” represents his weaker side. The bolder project of the concentric circles with *all* of the lines present in *every* religion, is the one that more adequately expresses the *ideal* of a universal human community. So my (logically generous) way of treating the “natural religions” is in principle the right one.

33. We should recall at this point that “Sense-Certainty” began likewise with “Now it is Night” (95).

34. Walter Jaeschke (1979, 198–204) argues that Hegel’s *Lichtwesen* is not really Iranian at all, but an interpretation of Yahweh. We cannot deny that Hegel’s studies of the Old Testament were more influential in his thinking than any other recollected “experience” here. But if he was guilty of projecting a “Nature-Religion” behind the intellectual monotheism of

Moses and the Psalms, then he was not strictly faithful to his observational method. (This does seem to be the case with “Plant and Animal”; and his early interpretation of Abraham’s “experience” fits into this hypothesis—compare *T.W.-A.* I, 278; Knox, 186). But I prefer to give Hegel the benefit of the doubt here, by assuming that he had some knowledge of Zoroaster in 1806. Certainly he had more later; but even in 1797 I assume that his “Geist der Orientalen” (*T.W.-A.* I, 428–432; *Clio*, 7, 1977, 114–116) had more than the Old Testament as its historical foundation; and if Hegel’s *Lichtwesen* was only a guess at the riddle of Abraham, then we are only confirming it “scientifically” by reading in Zoroaster.

35. The religion of Light does not appear explicitly in the ms. of 1821—but see *G.W.* XVII, 100, line 3–104, line 13 (Hodgson, II, 44–46). In 1824 it is the “Religion of the Good or Light,” *Vorlesungen* IV, 254–259 (Hodgson, II, 609–621). In 1831—for which we have only an abstract made by D. F. Strauss—it is the “Religion of the Good” simply (*Vorlesungen* IV, 624–625; Hodgson, II, 737–738). (The point I am making here is made explicitly in 1831—*Vorlesungen* IV, 626; Hodgson, II, 740; but in view of the separation of Persian and Jewish religion in all of the earlier lecture-series this is not very good evidence for Hegel’s thought in 1806.)

36. Even in a world like ours, in which religious anathema has so nearly vanished that we are quite shocked to encounter it (as in the case of Salman Rushdie’s *Satanic Verses*) a peaceful revolution is unlikely. This is because all “insight” is necessarily just as much “bad” as “good.” Anyone able to see the general tendency of some change in society, must be able at the same time to see the bearing of that “tendency” upon her own immediately present interest and well-being (and the same applies, of course, to the “vested” interests of finite corporate bodies). This suggests that the bad infinite struggle between Good and Evil, *ought* to be acknowledged as the “self-conscious” moment of the Religion of Sense-Certainty.

37. In his generally sober and careful survey of Religion in the *Phenomenology*, F. Guibal refers to tribal totems (1975, 72n.). If we take this comment in the same trans-historical spirit as his companion-reference to the “flower-religion” of the hippies it offers some insight and does no harm. But we must remember that there is no regular connection between totemism and warfare.

38. Vegetarianism (like the name “plant-religion”) is only symbolically significant, of course. A modern “pacifist” need not be a vegetarian. But it is hard to imagine a naïve community that could feel or recognize “the brotherhood of man” without believing that “everything that lives is holy.” This is the real starting point to which the circle of “Religion” returns.

39. Sexual difference is the fundamental paradigm of “the particular” in Hegel’s philosophy of nature; and “particularity” is the logical moment that we have reached here.

40. D. P. Jamros refers “plant and animal” to Hinduism (1994, 141, 147). Hegel’s first explicit reference to the “Lawbook of Manu” is in 1824 (*Vorlesungen* IV, 236, 249; Hodgson, II, 333, 346). It is not at all probable that he means to refer to the Hindu experience even in paragraph 700. Any such reference would be quite superfluous, because the Greeks were aware (through Herodotus) that Egypt had a caste-system. Plato also refers to it in this way (and his witness is quite possibly independent of Herodotus).

41. The “religion of art” has the “animal-religions” behind it (see par. 727). But it is only after the “folk-spirits” are united into a “beautiful” pantheon—i.e. after they have accepted one another as *brothers* (as the “children of Heracles,” for example, in the case of the invading Dorians)—that they can become masters of the agricultural populations (the plant-religionists) who are already in occupation of the Greek mainland. (Before that, there were the

Minoan lords, who clearly represent an imperialist culture—a religion of the Understanding in Hegel’s terminology.)

42. These *particular* adaptations are what the Master-Craftsman of the next religion will take over and organize into a “universal” system of servile crafts based on the warring tribes that they inherit from the “animal religions.”

43. Hegel’s Berlin lectures show some slight knowledge of the nascent science of Egyptology. But this knowledge was not yet available in 1805/6.

44. It was from Kojève that the first inspiration for my interpretation of chapter VII A came. So I was amazed to discover, when I checked back after many years, how far my interpretation diverges from his. He refers not only to “totemism” but to “peoples who fight to the death . . . and do not know how to take slaves etc.” (1947, 240). That is the sort of arm-chair anthropology that we must avoid. But probably he is right to leave agricultural “labor” to the sphere of Understanding. The “Plant-Religion” begins in “gathering” (rather than “planting and cultivating”) cultures. But what is *conceptually* important is that “labor” takes on a new character when one does it for someone else, and under a life-and-death authority.

45. See especially Plato, *Phaedrus* 274c–275b. (*Vorlesungen* IV, 537 mentions the warring Egyptian tribes in connection with their animal gods. But that passage—from the second edition of the *Werke*—apparently belongs to the lectures of 1831. In that series Hegel came closer to the perspective of 1806 than in his earlier lectures. But this is only a weak support for hypotheses about his early theory.)

46. Here we have another indication that “*instinctive Reason*” should be identified with “Reason operating as Understanding.”

47. W. Jaeschke points out that the *Werkmeister* is also found in the Old Testament (1990, 198). This point seems to me sounder than his reference to the *Lehrlinge zu Sais* of Novalis (which I suspect Hegel of classing with the *Magic Flute*). Jaeschke’s attempt to bring in the *Archaeus Terrae* from Paracelsus seems mistaken to me because that is not a “culturally estranged” image of God. It does not belong to the “house of bondage.” Plato’s myth belongs to the Art-Religion, but bondage is not yet sublated there—as it is in the Christian vision. The *Archaeus Terrae* is an image of “instinctive Reason,” but a modern spiritual, not a classically “natural” one. (I think that this note illustrates why I object to the simple “typological” view of Hegel’s philosophy of religion. It is abstractly intellectual, not concretely historical.)

48. Herodotus, *Histories* II, 36. What the *Greeks* knew about Egypt is important not only because this was the main channel of Hegel’s own knowledge, but because the “comprehension” of the time is principally a matter of recollecting the Greek and Roman heritage of German-Christian culture.

49. Strabo, 17, i, 46; see also Pausanias I, 42, 2. The statues were actually of Amenhotep III (about a thousand years after the Pyramid builders). The “speaking” phenomenon only began more than a thousand years later (first century B.C.) when the top of one of them was dislodged by an earthquake. (Hegel eventually discovered—from his reading of Alois Hirt [1821]—that the statue was a Pharaoh. So he makes no allusion to it in his mature lectures on the philosophy of religion. But he still finds the “voice” spiritually significant in the *Aesthetics* lectures, where he records his sources—see *T.W.-A.* XIV, 281–282; Knox, II, 643.)

50. Baillie thought that Hegel was here referring to the Black Stone in the Kaaba at Mecca, “a fetish still worshipped by the faithful” (as he put it, 707). Miller followed Baillie with such perfect trust that he put the identification into the text. But one thing of which we can

be quite certain is that none of the religious phenomena of Islam form part of the phenomenology of the absolute Religion. Hegel did indeed regard Islam as a “religion of the Understanding.” But he seems never to have known much about it—or if he knew more than he made apparent, it was not important enough to need revealing. The Black Stone does, perhaps, belong somehow to the “symbolic” phase of Islamic “phenomenology.” But it cannot form part of any transition of the Absolute from the natural organic to the human form. Hyppolite recognized the reference to the statues of Memnon in paragraph 695; but he did not understand the “inner/outer” distinction in paragraph 696. So he ended by accepting Baillie’s suggestion. In his book he did not commit himself clearly, but in his notes for the translation he does. See Hyppolite (1946, II, 528 and 1974, 547); also Hegel, *La Phénoménologie* (Paris, Aubier, 1941, II, 221, n, 24). F. Guibal (1975, 74) has followed Hyppolite’s lead; and it is amusing to note that the master of deconstruction has leapt enthusiastically—rather than fallen—into this pit (see J. Derrida, 1982, 345).

Chapter 11

The Divine Intuition

VII B: The Art-Religion

At the point where the sculptor gives the God a human shape, a tremendous revolution occurs. The concept of "Nature," organic and inorganic, is turned upside down. We go from Nature as "given" to Nature as "made" (and raised into the universality of thought). The raising into universality, and the simple substitution of "making" for "observing," of inner for outer, of the self comprehending the world in its "night" instead of the world comprehending the self in its "light"—all this is achieved by the Understanding alone. But the principle of the Understanding is "externality." It is a thought that is outside the world. It is the more comprehensive "world beyond"; and its making is an external craftsmanship, which involves the reduction of all nature to the level of inorganic material; living human beings become building blocks for "Leviathan" the artificial and mechanical "man." (Hobbes, we might say, is the Egyptian scribe of modern Reason; and his great work is a "hieroglyph.")

No man-made machine is humanity itself. That humanity can use itself (and the life of nature generally) to make a social machine is the "riddle of the Sphinx." When we arrive at the artistic conception of man as a self-maker, the whole concept of the intelligence working on nature as dead raw material is inverted into that of "Reason" developing itself within a living organism, an organism that is both Nature and Intelligence at the same time. The human community creates its own "nature," by developing the potential for self-expression and self-knowledge that belongs to it by nature. Humanity now recognizes the full development of its "nature" as its God-given goal.

The transition from external authority, from the commandment of the divine intellect in the beyond, to the condition of "human freedom" in the Greek polis is quite hard to see clearly. The Spartans, who were the great champions of "freedom," appear just as authoritarian as the Persians whom they resisted, or the Egyptians who accepted the Persian yoke.¹ The condition of the Helots was in some ways worse than that of the serfs who built the Pyramids (or the condition of Israel in Egypt). But the Spartan citizens met in council; and everyone expected to understand the decisions for which they must be prepared to die, as well as the political constitution they were operating in and maintaining, and the worship of the Gods for whom they died. Their "lawgiver" was one of themselves, even if he was more of a myth than a reality; and in the archaic times, before their whole constitution was set in stone like the "laws of the Medes and Persians," they had a high

cultural life, and produced some of the best of the early lyric poetry. Above all, after reducing their Messenian neighbors to subjection, and creating the rigid constitution which that "mastery" required, they always showed good sense—or at least far better sense than Athens—about the constitutional freedom of other cities (including Athens when they defeated her). This is the true spirit of "freedom." The Spartans understood that the polis is a communal "work of art"; and that artistic creation is a "free" activity.

(a) *Playing for the Gods*

- 1./699. The Master-Craftsman has become a spiritual laborer. No more synthetic mingling of nature and thoughts.

The practical Understanding is the employment of thought to formulate the problems and goals of nature. In traditional terms it is "Reason as the servant of the passions." To be free, by expressing nature "beautifully," is outwardly only another of the passions, the objective of another contingent natural desire. Freedom is, indeed, a "natural" goal of the self; in the case of the Spartans, because they committed themselves so completely to the maintenance of "lordship," this goal retained its "naturalness." But the Hobbesian "naturalness" of the Spartan drive for "power" appears to us (as it did to the other Greeks) quite *unnatural*. It is the Understanding, not Reason, that is fixated on "mastery." The goal of "free" expression is to create something for enjoyment. The master-craftsman (*Werkmeister*) was a "spiritual master." The free artist, says Hegel, is a "spiritual laborer" (*geistiger Arbeiter*). He labors for the Absolute Spirit; and just as the *Werkmeister* is not simply a *Herr*, so the artist is not simply a *Knecht*. The *Werkmeister* is more than a *Herr*, because he really does know what to do, and by actually shaping the social world his orders shape the subservient consciousness like raw material. Equally, the artist is more than a *Knecht*, because his labor does not only shape the world (like that of the serf); it also shapes the divine "lords" whom this "spiritual laborer" serves. And he serves his Gods freely or ethically, not in fear for his life. He is ready to lay down his life in their service, precisely because he shapes them so that they express his own will. To have a free will is primitively to be ready to die for what that will is set on. The spiritual laborer is as much a lord as a serf, because he is ready to die for the divine ideal that he has himself made. He portrays for the community a rational goal or content which the primitive natural urge of self-assertion aims to realize and maintain.

The Master-Craftsman was an *imaginative* version of Newton's God.² The image of Him that God's Egyptian servants made, represented him as a blending of the rational (human) with the natural (animal) form. The result was a "monster in shape [the Sphinx], in speech [the babble of the Oracle] and in deed [the social Leviathan]," as Hegel put it in paragraph 698. All such synthetic monstrosities are now given up. The Gods are created in fully human form; and their human community spontaneously creates itself in the shape that is "natural" to it—the world of the Cities.

- 2./700. The "actual" spirit that is conscious of its absolute essence in the Art-Religion is the ethical or "true" spirit. The substance here "has individualization" [e.g. as Athena] and is known by the single members as their own essence and work. It is not the universal Light as Lord of all things. Nor is it a war of peoples that do not recognize each other, nor yet a stabilized system of castes where the freedom of individuals is lacking.

The Art-Religion is the realization of an ideal created by the free will of a community which knows that it is the form of "self-actualizing" Reason. At the level of Religion, there is now a real community that projects its own self-image; so the ideal created is the self-conscious intuition of the life that has actually been achieved.³ The religious ideal is projected not as a goal, but for recognition, i.e. for appreciation and enjoyment. The projected ideal is necessary to the actuality of its community; it becomes the efficient cause of its own actuality by being already the final cause. By making this circle it escapes from the bad infinity of critical Reason (which can never realize its formal ideal of itself anywhere) and exists as True Spirit. Hence, if we use the word "reason" (as the Greeks themselves did) to designate the *actual* capacity that distinguishes human nature and human life from the instinct-governed existence of the other animals, then the Art-Religion is the "religion of Reason."⁴ "The *polis*," said Aristotle, "comes into existence for the sake of *life*; but it continues in existence for the sake of the *good life*."⁵ Human life is (by definition) the "life of Reason." So what distinguishes the *polis* is that it meets the needs of life as they are naturally given (in an aggressive species); and it does so in a way that liberates the distinctive human capacity of "Reason." The development of Reason can then become the goal of the "good life."

The "liberation" of Reason involves "mastery"; but the development of free Reason is a matter of artistry. "Mastery" exists here only in a sublated form. Aristotle was conscious that the *polis* was a supremely clever invention, as well as being "natural"; for any political society, its "inventor" was "the greatest of benefactors."⁶ But the "freedom" of the *polis* consists in the voluntary commitment of every citizen to its maintenance. The God of the City is their recognized humanity; she appears to them in human shape. Compared with them she is immortal; and the citizens know that she is also worshipped in other cities. But they know, too, that she depends on them, and on their mortal commitments, for actual presence in this world.

This circle between "life" and the "good life," maintained in a finite community by absolute commitment, is True Spirit. The consciousness of "freedom" can only be realized in a *community of communities*. Otherwise the absoluteness of the commitment on the part of the natural self-consciousness would make its "freedom" indistinguishable from "necessity." The Jews are "free" too, in their Covenant; but theirs is only the negative freedom of critical Reason, the freedom to fail, the freedom to be backsliders. The Athenian and the Spartan, facing one another as they take counsel about resistance to Xerxes, both know that they are "free" in a positive way. God is not for them the light of natural life, and the darkness of natural death; nor is he the spirit of natural rivalry (though that spirit almost triumphs over him, in a way that would bring the struggle for spiritual freedom to nothing). Nor is

God the death-dealing power of the Understanding which triumphed in Egypt by overawing all of the natural rivals, and slotting them into a caste-system of universal servitude.⁷ The Zeus of the Greeks is their universal Father, the spirit of a free people, who know that they have made their own way of life in a variety of empirical shapes; and that they must fight for their common freedom to do this.⁸

- 3./701. The religion of this spirit is an elevation above this actuality, a return out of its "truth" into the knowledge of self. In actual life there is immediate unity with substance and no pure singularity of self-consciousness; so this religion emerges in its perfection, through a divorce from its stable actuality. The actuality of the substance depends, first, on its unchanging stability, and on the fact that self-consciousness is at home in it. But also it is differentiated into many functional sub-groups, so that the single members have to be content with their limited places. When they experience the joy of their singular freedom, trust in the thing-substance gives way to the certainty of self-understanding. The *perfection* of ethical life turns over into the liberation of a singular self in which it perishes. The emergent self-certain spirit is left to mourn its lost world and dream of one elsewhere.

In large measure, this paragraph is a summary of what happens in Hegel's chapter VI A. But that story is now integrated into the evolution of religious consciousness, so that some new logical points occur (or become apparent). One of the most interesting of them is that because the moment of "singularity" is to be excluded as far as possible from the ethical consciousness and its deliberations, the community needs to have the moment of its own "individuality" religiously available for everyone's intuition in a "sundered" form. The "individuality" of the Goddess Athena is to take the place of private (or singular) self-consciousness. In her, all singular consciousnesses are united, and no longer "divisible." To answer the question "who are you?" with "I am an Athenian," is not just to say "I belong to the physically permanent community of Athens" but "I am one of Athena's people, and that I shall be even when I am dead."

The Greek "political religion" is the conscious experience of the sense of *commitment* that constitutes the "truth" of Spirit. It is for this reason that the religious experience of the City's sacred things and ceremonies must be distinguished and separated from the work of the Assembly, the courts, and the campaigns. The worshipper may not even be a citizen; those who are not free can feel themselves to be "Athena's people" too. And apart from those who have no share in political life even in a democracy like Athens—not only the servile majority, but the female half of the free population—there were many distinctions of status among the citizens in the non-democratic cities. Hence the "actual" spirit of a *polis* had two sides—the "Unchangeable" consisting of its Constitution and Laws;⁹ and the "organic" aspect consisting of the variety of social estates¹⁰ and fortunes, with all the highly differentiated duties and responsibilities that this organic structure entails.

The "absolute movement of Self-Consciousness" must pass back and forth between the unity and the variety, because it is of the essence of the free community that its members are conscious of making a free commitment to it. The

“truth” of Spirit requires that this commitment should be both primitive and absolute. In other words, it should be the indubitable context of all thought and all decision. This is the condition that Hegel calls “trust”; the “Unchangeable” aspect of the community life is seen as coming from God, and as removed from all possibility of dispute and controversy. The Constitution rests upon universal Greek “customs” (Antigone’s “unwritten law” of Zeus).

When the Sophists began to compare the ways of life in different cities critically, and even to suggest that the non-political customs of barbarian societies should be examined without prejudice, the civic commitment called “trust” lost its absolute status, and the “absolute movement of Self-Consciousness went into itself.” Self-Consciousness now asserted its “absolute right” as *singular*, and the principle of “rational singularity” was born. The “truth” of Spirit became a mere myth. Thrasymachus proclaims that “Justice” is only the interest of the ruling class; and Critias even puts forward D’Holbach’s view that religion is a mass of fictions invented and manipulated by cunning leaders.¹¹

This *critical* “return into self” must not happen. The maintenance of “trust” requires that when “the absolute movement of Self-Consciousness returns into itself” it must find only the divine guardians of the City’s “unchangeable” aspect. The tragedy of Antigone concerns the way in which absolute “trust” is bound to defeat and destroy itself, because it is inevitably one-sided, and the “absolute right of self-consciousness” is one of its (still unconscious) “sides.” Creon and Antigone are both “lightminded” in their very earnestness; and their story reveals how the “absolute right” is bound to be exercised, even before it is recognized, and when no one is meaning to exercise it.

The function of the religion of True Spirit is to put off the evil day when Critias and Thrasymachus will appear in place of Creon and Antigone. It does this by giving the unbounded “light-heartedness” of Self-Consciousness an open field, in which it can rejoice and actually be without a care at no actual cost. Everyone can go to the play. Even the slaves knew the stories, as Hegel remarks in the only reference to *Greek* slavery that he made in the unpublished early manuscripts.¹² At the play (or listening to a Homer chant) everyone is just a *Greek*; it is only the knowledge of the language and the tradition that matters. Slave or free, man or woman, young or old, rich or poor, King Archon or one of the old age pensioners earning a daily dole for serving on the jury in the courts—all such distinctions fall away. But the *knowledge* of what the distinctions are *for* is not lost; it is reinforced.

Hence, there would be many ordinary unintellectual folk who went home after watching the *Antigone* having understood what most modern audiences do not recognize—that Antigone was in the wrong as well as Creon. That recognition is what makes the experience a concretely *religious* one in the context of True Spirit. This is the *serene* enjoyment of the “absolute movement of self-consciousness.” It has free play, and it does not “withdraw into itself” but lets itself go into what is happening “out there”; it watches. Even when Euripides presents someone who says that an oath is only a movement of the tongue, not a commitment of finite spirit to absolute spirit; or when Aristophanes has “Socrates” tell us that Zeus is a myth and the

Whirlwind is our divine king, the point is still that oaths are sacred, and that children must reverence their parents as they always have done.¹³ But by that time the “serenity” is gone because the mortal children of Zeus are embroiled in a universal civil war. The “unrest of consciousness” cannot be kept in its playfield. The audience laughs; but, unintellectual as they may be, they go home troubled in their minds like the poet. For the “ethical order” is visibly passing away, and the whole actual structure of life is being carried off by the whirlwind.

Art becomes Thought, because the world changes. Plato, the dramatist of thought, is still an artist. The liberation of thought from art, the return of Self-Consciousness “into itself,” its becoming independent of the world, involves the prior destruction of the world in which thought had the supportive (artistic) function of preserving the “truth” of what men had achieved, and enabling them to see it and appreciate it. Aristotle’s “science” and Alexander’s Empire arrived together.

The freedom of thought arrived completely when the Stoic could say that we are all the children of Reason, sparks of the divine fire. But he could say that only because his audience were all estranged from their actually differentiated social existence. Law was imposed on them, and authority did not depend on them—even when it was not, quite visibly, the Thrasymachean “law of the stronger,” and the tyrannical authority of the sword. The Stoic children of Reason have no home in this world. For what has Reason to do with the purple mantle of Marcus, or the fetters of Epictetus? Yet the mantle and the fetters symbolize the social environment in which these lost souls ought to be “at home.” The home of the rational soul is “within” (or as Plotinus will eventually say, “Above” or “Yonder”). The “liberation” of Self-Consciousness is the incipient “unhappiness” of Consciousness.

- 4./702. In the epoch of true Spirit absolute art emerges. Before that there is instinctive laboring of Spirit in nature. Later there will be not just the self giving birth to substance, but a created art-work that recognizes itself in its concept [the Christian self].

“In an epoch of this kind absolute art comes forth.” The only ambiguity here concerns whether the “mourning” for True Spirit by the Unhappy Consciousness is included in this “epoch.” The right answer is that, as far as the *production* of art is concerned, the period after the downfall is not included; but that if we attend very precisely to what Hegel actually says, it is the case that “absolute Art” comes forth *as Art*, only when the Art-Religion has “fallen.” This is clear in paragraph 753. We ourselves continue to create works of art now, long after the “downfall” of the Art-Religion; and our models of what can be achieved come from the epoch of the Art-Religion. But Art does not now express the Absolute Spirit; and in the time of the Unhappy Consciousness nothing did that properly.

We can say, if we like, that at that stage, “thought” expressed the *absence* of Absolute Spirit. But this negative expression of it was the silencing of speech, and the stilling of the movement of Self-Consciousness into the feeling of “devotion” towards what was absent. It was “thought” but it was not the thinking that consciously posits its own existence.

Greek art speaks to us now of the memory of the "True Spirit" that has flown from the world; but it exists now "absolutely" as Art because our religious experience has become separate from it, and has left it behind. This point is important, because the project of the chapter rigorously implies that the experience expressed, and absolutely known, in Art is to be repossessed as a moment in the "absolute Religion." The Unhappy Consciousness is the birth-time of the "absolute Religion." But the absolute Religion's proper "recollection" of its genesis cannot even begin until it comes to maturity. Then we shall see that Art also had its own *religious* place in the development of the absolute Religion.

The experience of *Art* as "Religion," is the intuitive awareness of the Absolute Spirit as a "Substance born from the Self." Even in the stage when the Understanding is the absolute power, and when both the people's God, and the people's real governor, is a "master-craftsman,"¹⁴ we already find Art as subjective competence, and as the skill to make something expressive or *symbolic*, of the "absolute essence." And afterwards, even in the serf's experience, "formative activity" is the experience of spiritual freedom; but this "instinctive" activity cannot be identified as a form of free self-consciousness in society.

A proper artist is essentially free; and art can only be the expression of "what is," when the artist expresses at the same time what *she* is.¹⁵

The final long sentence of the paragraph explains the status of our modern art as a moment of the *absolute* religion. Classical Art directly mirrors the actual ethical substance for the religious appreciation of the Greeks themselves. Beauty is its absolute (or "infinite") aspect; but what is made beautiful is necessarily tragic in its actual finitude. In the absolute experience of Religion as such, this immediate unity of opposites is mediated. The tragedy is thoughtfully comprehended, and the inversion of fortune is comprehensively inverted into a spiritual triumph over death. This is the establishment of the realm of the Spirit as absolute and "free." It comprehends the actual realm in all of its necessity, and does not change that necessity in any way, because natural necessity is the constitutive nature of Spirit as substance.

But in the world of the Spirit that is returning from "estrangement," this substance is comprehended as the substance of the *thinking* self. The tragic comprehension of the artist was simply the subjective apprehension of how the subject is comprehended in the substance. This was a purely theoretical comprehension which (in the works of art recognized by the community as its "ideal" expressions) exactly matched the practical or real comprehension of the individual in the community. But our modern *thinking* comprehension transcends the sense in which the thinker is comprehended in "nature" (including the aesthetically "natural" community), and makes possible the self-affirmation of each and every individual as the universal subject incarnate in the natural social substance. This is what is expressed in the absolute religion as the infinite *love* of God for every one of his "children." Mythically or as a *Vorstellung*, God's love is portrayed as the "Kingdom of Heaven." But we must read the myth rightly; the "eternal life" of which it speaks refers us to of our experience of eternity in this present life. The "experience of

consciousness” must never be taken to refer to a life beyond the actual life which (as self-consciousness learns in its very first “experience”) is its one and only “place.” The “beyond” of any experience can only ever be another experience that takes place now and here. The “absolute Religion” is the finally self-comprehensive *concept* of “experience” as this process of conceptual growth and self-appreciation. Or, more precisely, it is itself the experience of that concept as an object.

In this higher, properly conceptual, mode of experience, Art has to be recognized as the ultimate expression of “finite” selfhood. Each self knows itself to be eternally necessary, and to have “infinite” value (as the object of Divine love). In its artistic self-expression it expresses this for the community, while continuing (like the classical artist) to express the “infinity” of the community for aesthetic enjoyment by the community itself. But these two “infinities” are not perfectly reconcilable in an intuitive form. The consciousness of its own infinity could never have come to the finite self in any way except *tragically*, i.e. in antithesis to the ideal “infinity” (or “beauty”) of the community; and that tragedy cannot be perfectly sublated.

Thus, Art moves from expressing the tragedy of “life as finite,” to expressing the tragedy of *itself* as a finite mode of expression for the life that has thoughtfully comprehended its own infinity. It seeks “not just to give birth to itself out of its Concept [which it does], but to have its own very Concept as its Shape [and as “this self” it cannot do that].” But it can show forth this tragic problem, just as perfectly as it expressed the tragic aspect of natural life. It can express its own tragic relation to the *Begriff* just as perfectly as it expressed the tragic relation of finite to infinite life.

Hence Hegel says that the project of the art of our religious culture is that “the *concept* and the produced work of art know one another reciprocally as one and the same.” But whereas the identity of art and life is tragic for the life of the artist, the identity of art and the concept is tragic for her art. The expression of this tragedy remains just as necessary to the actuality of the *Begriff*, as the expression of the tragedy of finite life was for the actually infinite living “substance” whose ideality (or *Begriff*) it constituted.¹⁶

- 5./703. As pure self-consciousness [Religion], the ethical substance is the bringing forth of spiritual substance. It produces the pure [universal] form of human subjectivity. This, in its turn, is “the night in which substance was betrayed,” and made itself subject. The ethical spirit is resurrected out of this night as a shape freed from nature and its own immediate way of being.

The world that Art perfectly expresses is the ethical “ideal” of the natural order. Since this is a religious experience, it is a universal experience, though it is not an experience enjoyed in every moment of every day. Art is “the *activity* with which the spirit brings itself forth as object.” It is important to note that Hegel says “the activity *with* which” (not “the activity *through* which”). The activity of the artists is an activity *through* which the presence of the divine is mediated. The “activity with which the Spirit brings itself forth” is the religious experience of the worshippers. That experience is necessarily an experience of the art-works (otherwise what I said about the activity of the artists would not be true). But it is not simply that. The

things that the worshippers do as worshippers—ceremonies, contests, assemblies, processions etc.—are all part of the experience of “Religion as Art.” Once the works of art (in the ordinary sense) are removed from this context of life comprehended by everyone as “playing for the Gods,” art ceases to be the universal mode of religious experience—though it continues (in most cultures) to be one subordinate aspect of religious experience. But it is subordinate precisely because the experience of divine service as the free “play” of human self-expression can now belong only to the artist. Any purely aesthetic experience on the part of ordinary worshippers will be strictly *non-religious*—as D’Holbach, for example, might be enthralled by the Rose Window of Notre Dame, or Karl Marx might be transported in listening to an anthem by Orlando Gibbons.

The religious experience of art in the ethical order is not like that. Let us think specifically of the *Oresteia* trilogy of Aeschylus. In the *Eumenides* the Athenian audience sees the son of Agamemnon, the heir to the High King of Argos, come to Athena’s City for the resolution of his tragic situation. That resolution is found in the spectator’s own court, where his ancestors voted in the same way that he does. But for the voters in the play Apollo and Athena are visible presences. These human judges have lived full lives of ethical obedience and service, and they are free of prejudice as judges should be. They are the religious consciousness of “the single [agent] who has worked off every unconscious mode of being and fixed determination [of conscious life] in ethical obedience and service.” They do not decide impulsively (like Antigone and Creon) between the *Dike* of Zeus in the light, and the same *Dike* in the Underworld. They let Athena herself reconcile the two sides, so that Orestes goes free but the Furies are appeased.

In Athena’s resolution (which is only a practical expression of their tie-vote) the “Substance itself has become this fluid essence,” i.e., the essence of communal self-consciousness. It appears comprehensively as the daylight that understands the necessity of the night. In the *Antigone* it is clearly portrayed for daylight awareness, as the night in which the substance cannot help being “betrayed” by those most completely committed to “ethical obedience and service.”

Out of that betrayal emerges the absolute subjectivity of the military leader who makes law knowingly, and without reference to any will other than that of the army which he leads. That absolute subjectivity develops in a long night in which “substance was betrayed.”

It is the long, slow, birth of the Absolute Spirit as “subjectivity” that Hegel wants us to remember, when he describes the fate of the Greek cities in language that unmistakably recalls Judas leading the High Priest’s men to the man whom he kisses in the dark night of Gethsemane. *That* man, that finite subject, was the first to know in a conceptual way how we are all “one with the Father,” the absolute Substance. His death and resurrection was the religious *Vorstellung* of the final “tragedy of art” itself; and the long and tortuous history of that image uncovers every aspect of the tragedy of Art. For just as the “tragedy of life” is enacted by everyone in the Religion of Art, so the “tragedy of art itself” is enacted by everyone in the Religion of pure thought. This is especially true with reference to the

religious thinkers, the practical theologians who interpret the myth of the Resurrection for the universal community. Not without much agony and bloody sweat will “the ethical Spirit be resurrected as the *Gestalt* that has been freed from nature and its own immediate way of being.” The portrayal of the resurrection is natural and easy; and the artists of thought can readily portray even the spiritual actuality that is still a matter of “faith” for the finite spirit. But the full self-actualization of finitely-infinite spirit as “Reason” does not come naturally, and it proves to be anything but easy.

- 6./704. The *Existenz* of the pure Concept is a “Man of Sorrows.” He suffers violence at the hands of his world, but his pure self wrestles with the universal might of the essence, conquers it and makes his Passion its material, so that his unity with the essence emerges as the universal spirit individualized and imaged.

The Spirit “selects the vessel of its sorrow.” There is one sense in which this is obviously true. The man, Jesus of Nazareth, could not become the “Vessel of the Spirit’s sorrow” simply through his devoted consciousness of that sorrow, and his own will to be the vessel of it. Indeed, our record of him—which is the only aspect of his *Existenz* that matters to the “science of experience”—shows that he wished he could escape from being “the Spirit’s vessel” (in the inverted image of finite Spirit, he prayed that “the cup might pass from him”). But he was “chosen”—and his own “choice” was the *ethical* one, the tragic acceptance of fate.

The Spirit that chose him, and with which he tragically identified, was simply the actual spiritual substance of his culture, responding to, and comprehending (in its *substantial* way) his own self-definition as the *identity* of finite consciousness with “the Father.” First, he got just what was coming to him—and the “agony” of Gethsemane consists precisely in his recognizing the inevitability of what was coming. The “positive might” that imposed his Passion upon him was the “universal empire” of Rome.

But, secondly, many moral heroes have been engulfed by the social substance, and have passed away almost as unnoticed and as soon forgotten as those other victims (such as Blake’s Chimneysweep) who are merely typical of the life of their time. That Jesus became the “chosen vessel” resulted from his being there at the right moment; and it is plausible to characterize that “ripeness” of the time in terms of the phenomenal career of another mortal accident, the man who became the apostle Paul. For it was Paul who gave “the pure Self of the individual” its “negative might.” He made the crucial *Vorstellung* of the fate of Jesus, the one in which the universal concept of Spirit can for the first time be clearly discerned.

Thirdly, however, Paul did not “choose” Jesus, any more than Jesus chose himself. It was the “inhabited world” of the Roman Imperium which “chose” the *story* that Paul helped to make—the story in which the acknowledged climax was the curiously irregular “appearance” of the Risen Lord to Paul himself as a “great light” and a “voice.” The world’s choice took nearly three hundred years, and by the time it was properly made, it no longer mattered what the empirical

history at the source of the story was. The Good News that every believer would rise from the dead, and be saved, “wrestled with the unshaped essence” of Roman Law and military violence, and became its spiritual “shape”; the “content” of mundane authority was absorbed into the universal religion of God’s Passion for our salvation.

It was crucially important that this story was the “history of God”; and it could not be played with in the way that Egyptian priests and Greek poets had played with the story of Helen. There is plenty of that sort of play in the “apocryphal Gospels,” but they were suppressed. But what actually happened “under Pontius Pilate” ceased to be important, precisely because the *story*—which includes many things that every sober historian knows did not happen—was canonized. Hegel himself gave us what he regarded as the sober history of the Man of Sorrows in his “Life of Jesus” (1795); and it is the sober history that can be extracted from the “story,” that he depends upon here. The crucial episode is in the Gethsemane chapter, and in the Passion story that follows. Jesus is a “beautiful soul” who “gives himself up” to the universal Spirit that is his true self. But he recognizes the Spirit also as the almighty will that is fulfilled in the unredeemed world of those whom he tried in vain to enlighten. It is *God’s* will that he should suffer, not just the will of a human tyrant. Unlike the natural consciousness, he does not risk his life to prove his freedom; instead, he demonstrates his freedom, like a Stoic, by giving his life up freely. He suffers the violence of the world as his voluntary *pathos*; and through his death, his gospel triumphs over death.

But the man who dies on Golgotha, knows nothing of that triumph still to come. Jesus only enacts the Greek tragedy, the tragedy of natural life consciously sacrificing itself to the Absolute Life. That is why Hegel echoes the language of the Passion at this point. Jesus is the “perfect shape” of the tragic hero. Even Antigone, who being a woman cannot fight for her life, weeps and protests against her fate. Jesus shows his ethical manliness, by sublating his own protest, and accepting crucifixion as the will of God. He is the artist who is his own hero; he makes his own life into a tragic drama of reconciliation. So he presents the Greek artist’s made image of life as a fully self-conscious subjective experience, in which the artist is his own work.

The intuitive, or aesthetic, shape of the Passion of Jesus exhibits the conceptual problem of art as the self-consciousness of life. His story is necessarily chosen by the world, because it is the perfectly individuated portrayal of the fate of the Art-Religion and its world, and the dramatic demonstration of why the tragedy is inevitable. What Jesus *does* in Gethsemane (and afterwards until he says “It is finished”) is what the Greek dramatists said and showed about life; and he did it at the very moment when the “fate” of infinite unhappiness had overwhelmed the finite harmony of Spirit and Nature, or of Self-Consciousness and Life, which the Greeks achieved. The Gospel-story, written by Greeks in the universal patois of the “inhabited world,” is the last and greatest of Greek tragedies. It is when we see it as the *key* to Greek culture, that we understand most completely what Greek tragedy (as the heart of the Art-Religion) was about. Jesus is *every* tragic hero.

VII B(a): The Abstract Work of Art

"Abstraction" in this heading signifies "withdrawal and separation from life." All of Egyptian Art was "abstract"; and almost all of our modern visual art is "abstract" likewise, because we keep it in galleries and museums. Similarly, our Religion is "abstract" insofar as we confine it to Church on Sundays and "holy days." In our religious tradition "abstraction" began with "Remember the Sabbath Day, to keep it holy." The "devotion" of the Unhappy Consciousness was "abstract." The "abstraction" of Greek Religion begins with the making of a stone statue and its "house"; it includes hymns and cult activities generally; and it reaches its climax in the sacrifice and the Mystery cults. Sculpture is the visual symbol of "abstraction." In the communal sacrifice, "abstraction" is sublated, because religion and life are united.

(b) Religion in Abstraction

- 7./705. The first religious work of art is abstract and singular. It has to move toward consciousness, and consciousness has to move into it (through the Cult) [cf. par. 693].

We shall not come back to the tragic hero as a forerunner of Jesus until our detailed account of Greek religion reaches its climax. At this point, we return to the moment where the religion of Understanding perished, and the Art-Religion emerged.

The most interesting thing about the transition as seen from the side of Art is that the statue is now called the "abstract work of art." We can properly say that the whole world and standpoint of the Understanding is "abstract"; the manipulation of life according to plan necessarily involves "abstracting" from it in order to plan it from outside. In this perspective it is the continuity of aesthetic religious experience from Egypt to Greece that is evident. So we must ask why Hegel introduces the concept of "abstraction" as a defining moment of Religion at just this point. For "abstraction" is characteristic of Religion as a concept from the first. The Church, the "house of God," is a *place* of withdrawal, a *retreat* from ordinary life.

From our point of view, it seems clear that the "Light-Essence" is "abstracted" from all of the concrete variety of living experience. Its worshippers live and move in a world of natural consciousness and self-consciousness; and we are spontaneously inclined to call their worship of the Light-Essence "abstract" in distinction from that. But when we comprehend their experience properly as *religious* experience we shall not say that; for they themselves do not understand it in that way. "Religion" must always be taken as the community's most "concrete" mode of experience, that from which all others are "abstractions."

We can see this at once in the next phase of the Concept of "natural religion"; for the absolute object of the Animal-Religion is the actual life and substantial institutions of the *tribal* community to which the worshipper belongs; and every activity of life is "religious" in so far as it is directed towards the prosperity and preservation of the tribe.

But in the Religion of Understanding, the abstract intellect is sharply distin-

guished from every other aspect of life. The Understanding is life's *master*, and is the source of authority. One of the primitive names of God as the Light-Essence, was "Lord." God is always appealed to as the source of social authority; but in the religion of the Light-Essence, the "Lordship" of God's Word is not yet sundered or distinguished from the Lordship of his Works. To put it in a way that both Jews and Greeks would have appreciated, the Law of Zarathustra's God is not yet distinguished from the Lightning. God's Lordship is so absolute as to be superficial, because he has no proper "servants" yet. This is what changes in the Religion of Understanding. God himself retires to the noumenal world beyond death, while the priests and other experts who have understanding are his recognized servants in the world of the living, and the rest of the community are *their* servants. This society worships an "abstraction"; abstractness (or "beyondness") is the mark of what is holy.

In the Art-Religion, therefore, the first moment is the preservation of this holy abstraction in a sublated form.¹⁷ The Art-Religion is the religion of naturally self-conscious freedom. The divine does not appear as the intelligence that tells us (with absolute authority) what to do. That is why it must now appear in *theoretical* abstraction, as a free community on its own account and in its own place. In distinction from the actual *polis* the Gods themselves must form an ideal *polis*; and in their presence to us, the immortal separateness of their community is the first thing that must be represented. The means of representation is the same as it was in Egypt: the statue in its temple. Each God has her own "House" among us, *symbolizing* membership in the divine community "above." The Gods dwell "above" in the eternal daylight of life, not "beyond" in the eternal darkness of thought. But as the symbolic statue in the earthly house shows, they are like us, they live in an ethical community, under ethical lordship.

Thus the "cult"—which becomes significant as the distinctive separation of religion from life as soon as the (Egyptian) Gods withdraw into their own world, but which Hegel mentions now for the first time because he wants to designate only a relation of *equal* recognition as a proper "cult"—aims (like "consciousness" itself) at the sublation of the very "distinguishing" (*Unterscheidung*) upon which its existence depends.

- 8./706. We begin with a human-shaped statue in a temple-house for the community. But the temple now has a human architecture—no pyramid-crystals or plant shapes. The geometry is now one of straight lines and incommensurables—so that Understanding is anticipating Reason.

Hegel is clearly anxious that we should realize that although much of the "abstract" aspect of Greek religion looks very similar to the religion of Egypt, it is all quite different in significance. Indeed, he wants us to see the Art-Religion as a complete contrast to Nature-Religion generally. Logically it has to be a comprehensive inversion of the "Infinite" of Understanding; but the overarching story of God becoming Man creates a necessary aspect of continuity which tends to overshadow the dialectical contrasts; and at this point the functional character of

architecture, and the symbolic character of sculpture, are constants that Hegel has to acknowledge.

Greek religion is focussed upon statues in temples. This is a symbolic representation of how the human community *builds* its own world within the natural world, and *uses* its own natural resources of life, strength and bodily faculties. The Statue corresponds to the singular human agent, living and moving in the “house” which is the “universal” inorganic environment of her activities.¹⁸ In their architecture, the Greek artists themselves can only represent *symbolically* the freedom of human life in the organically creative here-and-now, as opposed to the perpetuity of death in the inorganically predictable realm of the supersensible. The Pyramids have the imperishable fixity of crystals, while Greek temple architecture expresses the fascinated interest of Greek geometers in the fact that the simplest shapes that could be drawn or constructed involved ratios for which there was no adequate numerical expression.

Hegel himself *suffered*—I think that is the right word in our more algebraic culture—from this Greek obsession. I doubt if it is (as he thought it was) a “logical” mark of the antithesis between the inorganic and the organic. But Hegel was moderately competent in mathematics, while I am not a mathematician at all; so it is hardly becoming for me to be dogmatic about his concern with “incommensurables.” What *is* culturally significant, I think, is the fact that Greek geometry was a theoretical science, whereas the Egyptian founders of the science were engineers; and as far as architecture itself is concerned, the important thing is that the Pyramids were real *tombs*, while the Parthenon was a symbolic *home*. Hegel’s speculations about crystals and incommensurables have no status in the “Science of experience,” unless and until we have some reliable evidence about what the Pyramid builders actually believed. We are entitled to “observe” both facts and logical relations of which the observed consciousness is unconscious; but if we could observe any absolute logical necessities in symbolism, it would cease to *be* symbolism. So the symbolism that seems “natural” to a modern Romantic sensibility has no scientific status for the interpretation of the Pyramids.

That Greek architecture is not adorned with organic plant-symbols *can* be read as symptomatic of the emergence of the “theoretical” Understanding (as Hegel seems to think). Humans have cultivated flowers and made ornamental gardens in all the urban cultures that we know of; so it may be right to comprehend the geometric starkness of Greek architecture as a mark of the emergence of the “pure” understanding. But Hegel’s suggestion that the imitative aspect of plant decoration is characteristic of the “practical” Understanding has some surprising implications. This interpretation flatly contradicts the thesis of Plato and Aristotle that the Greek artists were “imitating Nature.” Hegel adheres to the main line of Plato’s theory of the Beautiful, and rejects the formal theory of Art offered in the tenth book of the *Republic* as a dialectical pretence. The deeper truth—as he sees it—is that the Greek artists were Platonists. They cannot be interested in plants and animals because they seek to express in outward form the human ideal of life as experienced from within.

- 9./707. The God is fully human in form, although he has a symbolic animal beside him. This by itself shows that his nature is above the level of natural organic life. The God's essence is the unity of the Earth with the self-conscious spirit. But the God is *singular*, so at first he is identified with a natural element. The natural element has been spiritualized however, so it is only a dim memory—the Titanic phase of Greek religion has been conquered by ethical Gods. The Titans were the children of the Light-Essence mating with its opposite; the Olympians are the political communities themselves.

The way that Hegel describes the evolution of sculpture here shows that his “black stone” has nothing to do with the sacred object in Mecca. For that has never been subjected to the impious and idolatrous violence of human hands, whereas the stone of which Hegel speaks is an animal idol that is now transformed into a human image. The symbolic animal now *accompanies* the immortal human ideal.¹⁹

There is a rather naïve type of enlightened rationalism at the core of Hegel's reading of the Olympian pantheon. The Olympians were, he suggests, originally *identical* with the elements over which they later presided. Zeus was Sky, Poseidon Sea, Apollo was Helios, the Sun etc. This is the kind of interpretation found among the Greek enlighteners themselves—for instance in the Sophist, Prodicus.²⁰ But it is of little importance to the “science of experience,” because only conjectures are possible about such questions in any case. All that matters in principle is that the Olympian religion evolved out of a more primitive natural religion.

The theory given here about the transition from Understanding to Self-Consciousness—or from the natural elements to the ideal selves of the political communities—is not easy to reconcile with the postulation of a direct transition from tribal consciousness to national consciousness in paragraph 727. Hegel reads Hesiod's account of the theogony of the Olympians, and the battles between the Gods and the Titans, as the portrayal of the transition from Understanding to Self-Consciousness. But he does not attempt to interpret either transition in detail. Both of the transitions (from Understanding to Self-Consciousness, and from natural Self-Consciousness to Reason) have to occur. The Olympians can only emerge as the absolute (or “immortal”) shapes of rational Self-Consciousness, because they embody the sublated moments of Consciousness and Self-Consciousness equally. The Titans represent the Egyptian-Understanding phase of Greek religion; and in the first “generations” of Hesiod's story we can recognize the Light-Essence, the Earth-Mother (of the Plant-Religion) and the warring tribes. The Abstract Work of Art is concerned with the making of the Gods, i.e. with the evolution of the communal consciousness from Understanding to the free self-conscious Ego. But for the finite rational consciousness this transition is identical with the discovery of the *polis*, as the genuine “thinghood of Reason”; so there is also a transition from “Reason as Understanding” to “Active Reason” which is only just beneath the surface here.

The fact that Religion involves a “bonded group” of conscious categorical moments explains how all these transitions are linked. The transition in Reason is the properly political one, for which the work of the *heroes* (especially Heracles and

Theseus) is emblematic. The Greek poets did not “invent” either the Gods or the heroes. But they represented the ideal transition from natural religion to the religion of the “immediate” spirit of communal freedom and self-affirmation, as the triumph of Zeus and his Olympian family over the Titanic forces of nature. Zeus and his kin had to take over the Titanic functions themselves. But because of the comprehensive inversion that is involved, the contrast is much more important than the continuity. The Olympians have conquered the forces of nature; and the animals and plants they are associated with symbolize their “gifts” to civilization. The myths about Zeus and the Olympians express what the political communities know that they have done for themselves.

- 10./708. In this cultural process the flux of immediate life becomes stable. But self-consciousness is still restless. The artist has expressed the stable substance [of the *Volk*] but he may not express himself as its personal voice. He has to make himself an empty vessel, a prophet, and he cannot give the work a living soul. That soul comes from him first and the spectators later. Even if they forget it we must not do so.

Hegel believes that in the more primitive nature-religions the bad infinite was endemic. Primitive culture was an indefinite multiplication of tribal units; and religion likewise was an indefinite multiplication of spirits everywhere. In the Greek context we have only to think of the satyrs, nymphs, dryads, tritons—and then of the household gods and the ancestors. The Olympian religion brought order to this chaos, both natural and human. How this order was established in the actual world we shall have to discuss later; the poets did not produce that, they only recalled and celebrated it in their epic chants.

Let us take as our paradigm Athena in the Parthenon. Her people, the Athenians, believed they were actually children of her part of the Earth. They still revered a host of local spirits, and each family had its ancestor cult; but Athena was the guardian of it all, with her remarkably unfeminine combination of political prudence and military resolution.

How is this wisdom, this guardianship, to be expressed? There is a verbal tradition which has inspired the artist. But the statue in the temple is mute. Pheidias, no doubt, was pleased with Athena's image, and with himself. But if the ordinary citizens said, and he agreed, that Athena herself had inspired him, this does not alter the fact that he looked for and received commissions from elsewhere, and he certainly expected to be well paid for his work. He was, in fact, unjustly accused of stealing some of the gold supplied by the City's treasurers, for the decoration of the statue; and subsequently he was prosecuted, rather more successfully, for impiety, because he imaged both himself and Pericles upon Athena's shield.²¹ If he believed that Athena herself wielded the chisel, he was certainly intensely aware (just as we are) that the hands were his. But unlike his Renaissance successors he could not express that consciousness without impiety. The ordinary Athenians could find men, women, boys and girls in the great frieze, who were just like themselves. But everyone was ethically anonymous; and all were mute. By rendering himself and his great patron recognizably, Pheidias made the statues *speak* for themselves.

Unlike the Egyptian tomb-paintings, however, it is ordinary life that is represented in the Parthenon frieze. It is not the soul's journey to the other world that the frieze portrays, but a procession in the City itself; and everything is public. The Goddess and her great procession need the living audience (who know what it is all about). Someone must say what it all means; but whoever does that, must speak without appearing in her own person. For that sort of natural self-assertion is unethical (as Pheidias learned to his cost).

- 11./709. The general admiration must make the artist aware how different the people's consciousness of producing the substance is from his own. And if they are *submissive* to his creation, he has a *master*-consciousness of it. But he learns, above all, how different the work is from himself.

The religious rejection of the "cult of personality" (as we call it) teaches the sculptor that as far as the Goddess is concerned he is just one of her mortal children like the others. *She* is the Immortal. But the transition from sculpture to poetry is mediated through the consciousness of the artist, because he (or she in the case of poets) has the special role of the "middle." The people see the image of the Goddess (and of themselves in the frieze); and they know who made these images. So the sculptor is admired. He is the one who knows what was really involved in making the statue; but even the ordinary folk who make offerings to the Goddess know that they are not really offering gifts to the statue. They know that the statue itself is their first communal offering to the Goddess. If the beauty of it is what it really has in common with Athena herself, then the aspect of experience reflected in it is just the *joy* of life. The tremendous, lifelong, discipline and effort of "playing for the Gods" is not expressed. The artist has experienced that; now, like everyone else, he experiences the *joy* of it, quite separately.²² For him, the statue exists willy-nilly as the made thing, a perceptible object, through which his two experiences are connected. In the new, non-authoritarian social situation it is the artist who emerges as the *master* still. If he succeeded, it was because the Goddess herself inspired him. But this means that, as far as the statue is concerned, she made him the master of it; the people are her servants through it.

(c) *Religious Language*

- 12./710. For there to be equality the people must make God speak. Now the artwork has a real divine soul. Singular and universal aspects are united, as body and soul. The hymn is the unity of inward and outward devotion. Singing together in devotion the people is aware of its unity of consciousness.

The inevitable survival of the Lord/Bondsman relation in sculpture—though now as an *ethical* relation of voluntary admiration and homage—is a form of unequal recognition in which the Goddess herself ought not to be involved. In a *free* community there should not be distinctions in her relation with her servants. That the Athenians should prosecute their greatest native born sculptor for impi-

ety is *tragic*; but it is logically implicit in the title “maker of Gods” that was given to Pheidias.²³

So another form of expression is necessary in which all can be equally involved. This is the *hymn*.²⁴ We do have a collection of “hymns” among the works ascribed to Homer, and Hegel may have thought that some of them were originally folk-compositions for unison singing in the temple of the relevant God, or at the appropriate festivals. But he probably relies mainly on such sources as Plato’s idealized picture of the simple life (in *Republic II*); and on the more realistic ideal of the *Laws*, Book VII. Plato insists that the poetic talent of the hymn-composer matters less than the life she has lived, and the sentiments that are expressed. What is logically important about the hymns that Hegel refers to here is that they are anonymous productions, communally performed.

The Goddess—let us stay with Athena—actually *speaks* in the choral hymn of her people. They are all *one* in and with her. This devotion passes directly into thought. It is not stopped short at the brink, as in the Latin chants of the Unhappy Consciousness, where all sing together, but only the priest knows what is sung. It is quite possible that Hegel’s portrayal of Greek religion is influenced here by the hymn-writing of Luther; for the Reformer’s great hymns and chorales are a perfect example of the “universal infection” of which he speaks. No one thought then, or thinks now, of Luther as a poet. His hymns come directly from the Holy Spirit; they are like the translation of the Bible. But even children and the illiterate masses can learn them, and so participate directly and equally in the experience of singing; whereas in relation to the Bible the congregation must be passive even when it is read to them in the vernacular.

This anticipation of how the hymn will function once more in the absolute religion prompts some reflection on the role of hymns in the earlier stages. Hegel must have been aware that every community sings and dances for its God(s). But the degree of self-assertion involved in such performances is determined by the general conception of the relation between the community and its God. Thus, for instance, Plato admired the *fixity* of everything in Egyptian aesthetic-religious practice.²⁵ But that meant that there was no opportunity for individual self-expression, and hence no consciousness of a likeness between the hymn-singer and God; and in the worship of the Light-Essence the evanescence of song would be what attention was focussed upon. Language is the fundamental medium of religious experience; the Unhappy Consciousness is most remarkable for its reduction of language to mere thinghood. But language has many aspects; and now that the topic has arisen Hegel is going to illustrate this at once.

- 13./711. The hymn is different from the Oracle, which was the first speech of God as the power of spirit in nature. In the Oracle God speaks as an alien power, not a self; and what God says develops, beginning with a simple proverbial wisdom that seems trivial to more advanced cultures.

The primitive divine speech was the Oracle. The Oracle belongs to the natural religion of unequal recognition; and its proper form is some natural phenomenon,

for God speaks in it as the spirit of universal nature. The Greeks had an oracle of this kind at Dodona, where Zeus spoke through the rustling of the leaves of his oak-tree. But the greatest oracle of the Greek world was at Delphi, where Apollo took possession of his human priestess, who spoke in a trance.²⁶ When the God expresses himself through the sounds of nature (and other phenomena, as in the taking of auguries from the entrails of sacrificed animals) the significant point is that a divinely privileged interpreter is necessarily involved. The language of "God as Nature" is *alien*; this aspect of divine speech survives in the Unhappy Consciousness, which makes even hymn-singing oracular. But in its proper use, the hymn is the language of universal self-consciousness.

Hegel refuses to call authoritative speech a religious revelation at all. Instead he calls all oracular utterance, from natural noises, and babbling trance sounds upwards, an expression of the "Concept" of God, but not a "realization" of it as Religion. The experience that is properly religious is universal; Religion "realized" is absolutely democratic. Thus we can all share the actual religious experience of God as mysterious and unintelligible. But when someone is recognized as the God's privileged interpreter, a concept is formulated but not "realized"—we have here not a proper concept, but the *Vorstellung* of an absolute communication. It is not a realized Concept because it is not yet a *universal* experience. God must *say* what everyone needs to know, in a language that everyone understands; and he must also say it "in their hearts."

In the nature-religions God speaks initially as a singular *Lord*. Thus "the universal spirit of the Sunrise who has still not specified His way of being" speaks through his prophet Zarathustra; and his invisible twin, the God of Abraham, speaks through the prophet Moses. But everyone who hears his commandments recognizes them (just as Moses Mendelssohn did) as the deliverance of healthy human understanding.²⁷ This God says only what everyone in the more advanced cultures is bound to know; and in the free community of the Art-Religion, Antigone will hear this voice without any need for the mediation of an authoritative prophet.

Eventually, in the modern Enlightenment, this sublime wisdom of nature—the revelation of God as "Reason"—will become trivial. But, at first, God speaks through prophets and oracles. Where God is an alien consciousness the "mediator" is essential; but only what is expressed for the people in its own language properly belongs to the concept of Religion. Thus there are different degrees of realization, depending on "the universal determinacy in which the absolute spirit is posited." The concept of "God's speech" is not fully realized until we reach a consciousness like that of Antigone (a consciousness which Goethe could misread as "Conscience").

- 14./712. This simple wisdom becomes an inner oracle in the culture that has a free consciousness. Antigone does not have to consult Delphi to know what God's law is. But God must speak about the particular problems that face his people. Socrates has this "particular" oracle inwardly, alongside his knowing consciousness; but in public life what

cannot be decided by custom or reason is left to augury from natural phenomena, or trances induced by the Earth's vapours. Where one tries to decide rationally what is best for oneself, one is only consulting the oracle of one's own character; to appeal to the Oracle shows that we are prepared to leave our accidental fate to God because it is not what is important. The highest state here [Socrates] is to deliberate, but to *know* that one is only consulting an oracle in doing so.

It is clear that Hegel wants to regard all prophetic revelations as "oracular"; and that he does not regard anything as the proper speech of God except what every worshipper says or can say "for God." This universal speaking for God begins properly with the Greek *hymn* (as Hegel interprets it). But in the "practical" mode of most oracular speech, the paradigm case of God's proper speaking is the oracle that Antigone finds in her own heart, when she is faced by Creon's edict. She only says what everyone knows (and Haemon tells Creon that the whole City secretly sympathizes with her). But she does not cite the authority of Homer or anyone else. Her oracle is "the secure and unwritten law of the Gods . . . that lives forever, and of which no one knows from whence it appeared."²⁸ She is *Meister* over the "pathos of Substance," i.e. she self-consciously comprehends and asserts what "prophets" like Zarathustra and Moses "suffer" as God's command.

Antigone also betrays the Unwritten Law because she is "master" of it. The betrayal springs from the mastery, and it resembles the introduction of Pheidias' own image on Athena's shield. But the inevitability of it is implicit in the fact that everyone knows the law to which Antigone appeals without being told. Hegel says, very instructively, that "the universal truth that was *revealed* by the Light-Essence, has here retreated into the inner or the under[world]." No one could get into Antigone's situation in the culture of the Light-Essence, because in that culture no one has the conscious "mastery" of the revealed law. Ismene's view that it was not Antigone's place to defy Creon would have absolute authority in the world of the "nature-religions."

But, now, in the world where everyone incarnates the Ethical Spirit, the alien oracular voice which formerly spoke universal truths through Zarathustra and Moses, falls from being a voice of universal wisdom (which none of us now need) to the level of a *particular* wisdom that tells both the community and the private individual what to do at some critical juncture of life. Everyone knows what to do in general; no one needs Zarathustra (or Moses) to tell them that. But just as Socrates distinguished the deliverances of Reason (for instance, the protests of "the Laws" against his supposed right to run away from an unjust death sentence) from the unreasoned feelings of constraint that came from his *daimonion*, or "divine sign," so the ethical community distinguishes between its universal customs, and the particular situations of empirical uncertainty in which *it* seeks for "divine signs."²⁹

As far as Hegel is concerned, appealing to Delphi was just like tossing a coin, or throwing the dice. He knows that that was not how the Oracle's clients regarded it; but he also knows that when Plato's Socrates refers to Delphi for the "abstract" religious arrangements of his ideal City, he is speaking in this same ironic spirit.³⁰

It is the problems that can *best* be settled by the toss of a coin that should by custom be referred to the Oracle. Otherwise one should use one's understanding as well as one can; but always with the clear awareness that one must be ethically indifferent to how things go wrong (if they do).

- 15./713. The hymn is the self-conscious being of True Spirit. But the voice in the hymn is transient, while the statue abides.

The *hymn* is the first "true" being of Spirit as language. It is the necessary complement of the statue, which is a symbol of the substantial permanence of Spirit as what "truly is." But the singing of the hymn is a transient moment of experience; the community is consciously at one for that moment, but then they fall apart into their private selves again. Thus the tragedy of the Art-Religion is clearly foreshadowed in its "abstract" realization. The statue symbolizes immortality; the hymn realizes living unity. But each of them is an abstract moment. The stone is abstracted from life; the singing is abstracted from life's differentiated variety. The hymn is the sense-certainty of Absolute Spirit. But its thinghood is only symbolized by the stone statue. Both are beautiful; but the twinning of their beauty expresses only the tragic impossibility of their unity.

(d) *Religious Cult*

- 16./714. In the cult it all comes together. God descends as a self-consciousness on his own account.

The tragedy is only implicit. We must remember that Antigone knows exactly what the *Dike* of Zeus requires; and she is a typical citizen in that respect. Everyone knows what she knows, and they know it all the time. Thus when the Athenians come into the presence of the Goddess—who stood in stone as Athena the Champion outside the temple of her virginity, and sat enthroned inside it in all the splendour of ivory and gold leaf—when they come to sing their hymn, they are only giving a formal, "abstract" expression to the truth of every moment of their lives. The Cult expresses something just as permanent and abiding as the stone of the statue. Only when Athena's children fail her as a community can the temple be robbed of its ivory and gold—as it eventually was. When they sing to her they are saying she is with them; and she is indeed with them, because what they sing is still true when they go to the Assembly, or go home. Hegel was taught in the Tübingen *Stift* that the Greeks were "idolators"; but he rightly insists that they did not worship the statue. It served the same function in their cult as the crucifix did in the Lutheran piety of the *Stift*. The mistake of the "pagans" was just that their Goddess is not an "immortal" (as they believed and said). She will die when the City does. But in their cult God is truly "revealed," because She is truly "incarnate." She "comes down from Heaven" just as the Crucified One does. The echo of the Christian symbolism here is very deliberate indeed.

- 17./715. The cult is the developed concept of the hymn. It is the abstract purification of the soul to receive God. The purification does not yet involve *repentance*; it is ceremonial cleansing for participation in the Mysteries.

The hymn sung in the presence of the Goddess is only the seed or germ, so to speak, of the full cult of Greek Religion.³¹ Hegel finds the full expression of the Cult in the Mysteries. Depending, as he did, mainly on the *Frogs* of Aristophanes, he knew that the Mysteries of Eleusis were part of the religion of the Underworld. But from what Aristophanes presents, together with what Plato, and others, say, he inferred that the Mysteries were “open secrets,” and that the *impiety* of “revealing” them did not consist in saying something that was not generally known.

The Mysteries formed a climax of religious experience where the worshipper was concerned with her salvation as a singular individual. But the singular individual remains an abstraction in the ethical order of True Spirit; and the Mysteries are concerned with the singular self only as a natural life. So whereas Hegel underlines the anticipation of the Incarnation in the Hymn, he takes care now to underline the *difference* between the symbolic purification of the body for the Eleusinian Mysteries of the Bread and Wine, and that purification of heart for the Mass which filled Luther with such terror after his ordination. The Eleusinian purification is ceremonial only; and the experience is imaginative only.

“On account of its abstraction, [the purified soul] is not the consciousness that distinguishes its object from itself, and so it is only the night of its being-there and the *place made ready* for its shape. Hence the *abstract cult* raises the self to the point of being this pure *divine element*.” These are the difficult sentences in this paragraph. First, we should notice that Hegel speaks consistently of the *Seele*. Scientifically, this means the “life-principle”; and that is what it meant for the Greeks; what Christians refer to as the “soul” is in Hegel’s science “the Self.” The *Seele* acts consciously, but it is not yet the “Self” of the “Beautiful Soul” (as Hegel goes on to tell us).³² The Greek mystic soul has natural being (*ist ein Seiendes*), but in the mystic purification it *forgets* (becomes unconscious of) its status in the world. It is only the principle of natural life, “the night of its *Dasein* [as the self]” and the “place made ready” for the spiritual “shape” that it will self-consciously assume in the “living work of art,” and above all in the spiritual work of Art. But Hegel emphasizes the expression “*bereitete Stätte*” because it is an anticipatory echo of the *Christian* “mysteries”; in that returned form, it is the *Beautiful Soul* that is the “place made ready”; and the “objective *Dasein*” that it is ready for is the “body of Christ.”³³

The “purification” achieved in the abstract cult of the Art-Religion is the first “station” of the Soul on the way upon which it “purifies itself for the life of the Spirit” (par. 77). We have already seen that the tragedy implicit in the antithesis between statue and hymn, is the experience of the Absolute Spirit as Sense-Certainty. But we ought to have said “sense-certain Self-Consciousness,” since the Absolute Spirit as simple Consciousness is experienced in the Nature Religions. It is the Light-Essence in its transcendent *otherness* of which Sense-Certainty can say only that “It Is.” With the Art-Religion as cult, we enter the “homeland of Truth”

where the Absolute ceases to be transcendent and makes its first appearance in its proper shape (as the "I that is We, and the We that is I").

In the religion of the Light-Essence it was Consciousness that was the determining or defining moment. Now it is Self-Consciousness; but for this free Self, its naturally finite being (*Dasein*) is a dark unknown, still hidden in the "night of the Self." For this natural principle of self-consciousness, for this "soul," its body is a *thing* to be used freely. But its "first experience" was the discovery that body and soul are inseparable partners who must march together on the way of "purification for the life of the Spirit." The washing and adornment of the body for the mystic sacrifice—which was, of course, a banquet—makes *it* the "prepared place" for the appearing of the Spirit. The "I that is We, and the We that is I" is about to make its appearance in real life, as the *Volk* in its Games, Processions and Poetic Festivals; so the mystic "preparation" of the body is here put into its logical place. But it is only a preparation of the body—the conscious "object" of Self-Consciousness.

Hegel's initial reference to the Eleusinian Mysteries as the *practical* transcendence of Sense-Certainty through consumption and enjoyment, and as a step towards "absolute knowledge" which even the animals make (par. 109), falls into place at this point. The Mysteries "teach the truth about sensuous things"; specifically, they teach the true relation between the animate body and other things. *Abstractly*, on the other hand, the soul prepares itself for the long, hard discipline of the way ahead. But it is joyful, not grim or despairing.

- 18./716. The Mystery is a *secret* one in its first aspect. The worshipper must go forth and *live* the truth of it. The descent of God in the cult must become public and actual.

"Only at first," says Hegel, "is this cult something secret." Its secrecy is identical with its abstraction. To speak of what is experienced in the Mysteries was impious, not because the content of the experience should not be revealed, but because "speech" was absolutely the *wrong* way to reveal it. In the mystic cult it is "secretly experienced" in the mode of speech; and the cult is quite democratic; no true Greek is barred from it. But the true meaning of the linguistic experience (which is the *Vorstellung*, the imaging of a life of "purification"), is a life of active commitment. One must not talk about it, because it has to be lived. The purpose of the *Vorstellung* is to aid the initiate to rise into *pure* self-consciousness, i.e. the awareness of union with the divine, or universal self-consciousness. The descent of the Goddess into the singular consciousness, which takes place momentarily and transiently in the Hymn, must now be made actual in our lives. It is to be shown forth in action. The body, as the "place prepared" for the Absolute Spirit, becomes its dwelling place in truth. The worshipper freely gives her *life* to the statue. The Goddess has life, in the way that the worshipper has it, i.e. as a natural self-consciousness. She is "the soul," the life-principle, of her community.³⁴

- 19./717. For the single self-conscious agent the natural world is for his use; for the worshippers, however, Nature (as living) is divine. In *actual* cult, God is actualized, because the finite self is sacrificed to Him, while finite Nature is sacrificed to the self. The

action (of Sacrifice) has the double motion of sublating the abstractness of God into actuality, and raising the actual worshippers into universality.

It is interesting to see how in the experience of Absolute Spirit, the reality of finite experience reappears *both* preserved in its natural shape, *and* inverted by sublation. Hegel knew that the most important actual event of the Mysteries was the “sacrifice.” So, by putting what he knew about Greek sacrifices together with his interpretation of the purification rite, he produces the requisite circularity of the properly religious experience.

The “night” of the natural self that has not yet descended into itself, is the order of nature out of which the immediate Ego has risen, and to which it has opposed itself. In the finite perspective, this “infinite” order of nature is just a mass of problems and utilities. But as the “true Infinite” it is immortally alive; and as such it is divine. The natural self-consciousness recognizes itself in this “infinity”; and Nature itself is the Absolute Spirit which the naturally “self-conscious” (or free) community incarnates.

For the natural self-consciousness, Nature, the whole *world* of Consciousness, now has two opposite meanings. It is subordinate, merely instrumental; and it is superordinate, it is divine. The union of the worshipper with God is the resolution of this contradiction; for in its union with God, the soul becomes entitled to use finite nature for its own purposes. This resolution of the finite in the Infinite—as both “identity” (the Earth-Mother) and difference (her mortal children)—is what is portrayed in the sacrifice. The natural self-consciousness devotes itself to God (in the *Vorstellung* of “purification” which is to be lived out); and so it can participate with God in the enjoyment of finite life, and of its inorganic environment. This whole cycle is necessary in order that the divine, the infinite life itself, may become actual as experience.

- 20./718. This ceremonial sacrifice must therefore begin with a deliberate *wasting* (wine poured on the ground, flesh burned). Then the Gods themselves are eaten and drunk in their symbolic animal (for the upper powers) and real vegetable (for the underworld) forms. By the eating the worshippers show that *they* are the God’s higher form. Only when sacrificing to Hades is anything wholesome allowed to go to waste [the wine poured out]; otherwise what is wasted is only what is unusable. Thus sacrifice mainly asserts the union of man and God.

In the sacrificial rite a libation of wine was poured out on the ground, as the share of the Gods below; and the surplus fat, with the entrails and bones, was burned on the altar, for the enjoyment of the Gods above. But almost everything edible, or potable, was consumed by the worshippers. The Greeks were themselves conscious that there was something rather paradoxical about the claim that they were sacrificing “to the Gods.”³⁵ Hegel’s doctrine of the divine incarnation resolves the paradox.

Abstractly (or in thought), the return of what the community cannot use to Earth and Sky, expresses in an image the fact that everything, both natural and

human, belongs to the divine infinity of Life. The perishing of what we eat and drink, together with our own eating and drinking, are "reflected into the Universal." The worshippers are conscious that they belong to Zeus above, and to the Mother and the Daughter below³⁶ as absolute property. They are living *things*, perceptibly endowed with being-for-self (i.e. with freedom of choice); but as self-conscious mortals they recognize themselves to be produced by, involved in, and completely dependent upon, an *infinite* (i.e., immortally cyclic) life-process.

In the sacrifice God and man "die" for one another. But the prophetic anticipation of the mutual surrender in the Crucifixion is only symbolic. The sacrificial animal is a living thing like the worshippers. They have cared for it, and it belongs to them (as property). But it represents the God(dess) and in a spiritual sense it belongs to her. The animal eaten is the recognized *symbol* of the free spiritual life of the Olympians, and of their politically devoted children.

In the case of the bread and wine, the identity is closer on both sides. This is already food and drink, the actual sustenance of our mortal bodies; and it came directly from the "secret and cunning" life force of the everliving and fertile Earth itself. The Earth is the universal grave in which the seeds die, so that the plants may grow; and the worshippers will all find their last resting-place in her. In the sacrifice to the powers of natural life and death, therefore, there is no deceit. They share directly in what they gave. Our labor and skill does not go into cheating them. We begin the sacrifice by pouring some of the wine that we have made upon the ground; and whatever does not burn away on the altar, returns directly to the Earth.

It is the Olympians who have only a *symbolic* share (the smoke that rises to Heaven); for the free community itself consumes the *real* share of the Olympian Gods. The pattern as a whole reflects the fact that although the sacrifice, with the recognition and resulting incarnation of the Gods, is the free act and life-work of the human community itself, this community with its spiritual knowledge and creative activity could never have existed if the infinite order of nature were not already organized in the "cunning" way that generates finite life and rational consciousness. Humanity becomes the self-consciousness of the Spirit, by its own creative act; but it becomes the self-consciousness of nature, by Nature's own gift.

"The divine substance" (i.e. the ethical substance, the *polis*) is sacrificed really, rather than "abstractly," through the City's living service to the Goddess (which goes as far as the laying down of life by the young men who fight for her); but the divine "essence," which is the "truth" of life as Nature, "is sacrificed already *an sich*." The Gods take *shape* as the food we eat; and we owe them a death in some ethical shape.³⁷

The actual enjoyment of the feast is the moment when everything comes together. The transient, sense-certain, aspect of things is consumed; and the self-certainty of the community is both realized, and naturally sustained. By making the most ordinary and necessary act of life into a communal religious experience—by eating and drinking in the presence of the Gods and on their behalf, with gratitude and rejoicing—the community feels and expresses its unity with God.

- 21./719. So far, however, the cult is mainly devotion. Its universal significance exists for thought only. But in the building of the temple and its decoration everyone participates. All can bring offerings (not just the artists); and the temple is not just God's place but everyone's. The festivals are festivals of the *Volk* and of the families.

This religious cult (in the ordinary sense of the word) is "abstract" because it is consciously distinguished and separated from ordinary life. But the explicit function of distinguishing it as "the worship of the Gods" is to make a reflective (or thoughtful) statement about the relation of humanity, in its ordinary life, to the Gods. The "cult" is the open declaration that our whole natural and human existence—i.e. whatever freedom we can secure from the necessary round of maintaining life—is freely devoted to the service of the Gods.

The real significance of this thoughtful declaration (made verbally in the singing of hymns, and "secretly" or inwardly in prayer and mystic ceremonies, but understood perfectly clearly by everyone) is in the effect that it has upon actual life. Whether we mean what we say and sing, is tested at every point where there is opportunity to show it; and in the "ethical order" there are some easily identifiable testing-times. Men, young and old, must go to war; and their womenfolk must support their resolve, not hold them back. The rich regard it as the supreme advantage of wealth, that they can provide ships for the City's defence; and to be called on to provide a chorus (i.e. to put on a play) for a poet at one of the festivals is the highest social honor for them in time of peace.

This brings us to the circular concretion of the "abstract work of art." The "abstraction" of the Cult from ordinary life requires a mass of real things and resources. Temples must be built, statues not only carved (that is a divinely privileged task) but paid for (and anyone who has "freedom" in a monetary sense can do that). Processions must be organized and mounted, choruses and actors dressed and paid during the rehearsal time, etc. In the peacetime existence of the City, the regular practice of the Cult itself becomes an important medium for demonstrating in actual life the seriousness of one's declarations in devotion; and the Temple treasury was the public reserve for all military and economic emergencies.

When Athens became an imperial power under Pericles, with all of the disposable economic resources that that produced, he embarked on a great programme of "public works" for the beautification of the City. These public works were mainly the temples; and everyone could and did join, according to their differing abilities, in the building and adornment of them. Citizens dedicated all kinds of things; Heracleitus dedicated his book to Artemis, by depositing it in the great temple of his native Ephesus. So when we read Hegel's calmly scientific generalities about "the cult being the common or singular task that everyone can perform" we must linger with his words, reflecting on what they actually mean in the objective "phenomenology" of the Art-Religion—that is to say, its historical blooming in the "Fifty Years" which were its moment of perfect "appearance." The City of Athens had a social welfare system, sustained by its "allies"; and those who needed the welfare support had what was universally recognized as the most important of all work to do—they decided the cases brought to court. It is no great wonder that

Pericles, in spite of all his associations with “impiety” (both as free thought and as “unethical” modes of life), was impregnable in the Assembly against all of his more conservative opponents.³⁸

The best paradigm of the Cult as a “singular” task (i.e. a family responsibility) is offered by Cephalus (in the opening pages of Plato’s *Republic*). He illustrates the complex equality of “recognition” in the “natural” society that has passed over to ethical “freedom,” because he is a free Greek, but not an Athenian citizen. He and his family are “metics,” or resident aliens. He is a rich man, well able to pay his debts, both personal and social, and ethically secure, because he is conscious of having always paid them. We can logically infer, as he leaves us to “attend to the sacrifices,” that being a model of “justice” as he understands it, Cephalus is going now to do his part in the welcoming of the new Thracian goddess Bendis, to the city of his hosts. Socrates, Thrasymachus, and Plato’s brothers will all be participants in this domestic ceremony, when the feast is ready. The fortune that Cephalus has inherited and increased is that of a shield-maker; and the great war with Sparta has begun. But the Fire still burns brightly in Plato’s Cave; and this is what its private happiness was like.

Before we go on to chapter VII B(b), we should pause to consider what the “circle of the Abstract Work of Art” contains. In general, the Art-Religion is the “absolute” (i.e. communally rational) shape of “Self-Consciousness.” Thus the Abstract Work of Art is the circle of “natural Selfhood as the immediate self-consciousness of Life.” The actuality of the Art-Religion is the spiritual “Thing.” But in this first “abstract” phase we have noticed the particular importance of the moment of “sense-certainty” in the “perceiving” of the Absolute Self by its finite mortal members. At the level of Reason, we find ourselves in the sphere of “Reason as Observation” as far as the statue is concerned. But the presence of “Reason” is complex, for “Pleasure and Necessity” is certainly experienced here (emblematically by the artist, but universally in the Hymn and the Mysteries).

In the Art-Religion there is no “Individuality” except that of the City. So “individual” Reason is swallowed up in “True Spirit.” We can see that the Abstract Work of Art is just the first stage of the religious education by which the singular self is absorbed into the identical self of the Substance. It creates the God who is this universal self. We should notice that it is the “universality” of the Greek *Volk* that is emphasized at this stage, as much as or more than the “individuality” of the City. My solution for the formal problem is as follows:

Perception (First Moment: The Intuitable Ground)

The Self as *Satisfied Desire*: a) The Purely Immediate Ego (Statue)
 (Defining Phase) b) Self-conscious mediation (Hymn)
 c) The new Self (Mysteries and new life)³⁹

Observing Reason *finds* itself as a Thing (see pars. 349–350)

(The moments here are: (a) inorganic, (b) organic, (c) self-actualizing)

True Spirit A: The Ethical Order (The Olympian Order)

VII B(b): The Living Work of Art

In contrast to the religious Cult (which has “devotion” [Andacht] as its focus) there stands the direct expression of identity with God in the active life. This begins as an ecstatic identity with the powers of unconscious natural life, and moves through the self-conscious competition of the athlete, to the great public processions in which every citizen lives out the experience of identity with the divine subject of the City’s substance. (Among these processions, those of the drama festivals were especially important. So the Art-Religion unfolds as an unbroken continuum.)

(e) Religion as the Art of Life

22./720. This religious consciousness is quite unlike that of the [Jews, whose] Light-Essence is not spirit but an abyss in which their self-identity is lost, a Lord in whose sight no man living is justified. It is not yet monotheism [“abstract simplicity”]. Man *knows* himself in his God, but without the *depth* [of Jewish inwardness]. Instead, there is a relation of equal recognition.

There is no mistaking the intended contrast between the Greeks and the Jews in the first paragraph of Hegel’s discussion of the Living Work of Art. The topic of this section is going to be how every aspect of human political life is “lived *for* the Gods,” in so far as it can be set free from natural necessity. Here, the Jewish conception of “walking in the sight of the Lord” by following his Law provides the most obvious contrast. But the Jews actually remained invisible to the Greeks, just as their divine Lord remained invisible to themselves.

Yahweh was not the Divine Light of the Sunrise. He was the purely inward light of rational intuition. But from the standpoint of “natural Reason” that we have now reached, everything Hegel says is true about both of the “shapes” of the “Light-Essence.” This is because of the direct logical identity of opposites in the case of what is immediately “inner” (intellectual intuition) and what is immediately “outer” (sense-certainty, including all images and symbols). At the level of simple immediacy “thought” and “being” coincide directly. There is the transition (called “abstraction”) from the singularity of being, to the “universality” of thought. But the content is identical. Thus, now that we understand “abstraction,” we can recognize Yahweh as the abstract “thought” of the absolute *being*. He is the “It Is” of which we were visually conscious in the spiritual Religion of Sense-Certainty.

There is one significant difference (arising from the act of intellectual abstraction) between the Jews and those “Medes and Persians” who worshipped the “Light-Essence.” With the transition from Being to Thought, the Jewish people is conscious of *itself* as important to God. His choice of them, and their Covenant with Him, remains a mystery in the language of sublimity and “lordship” which they share with Zarathustra. But Yahweh is “the God of Abraham, Isaac, and Jacob”; and hence we cannot properly say that He is *selbstlos*.⁴⁰ We are up against the paradox of the primitive principle of natural Self-Consciousness. Being blindly negative, primitive self-assertion does not have a *determinate* self to assert. As a

tribal God Yahweh is just the corresponding principle of blind self-assertion; but he is the *Universal* God, and hence not simply an “animal” God. (I hope this was already clear in the commentary on par. 689.)

Yahweh is the God of a people that *thinks*—the God of negative Reason, or the absolute expression of the Self that knows what Freedom is *negatively*. Hence Yahweh has no sensible shape; and what He promises to His people is the enjoyment of natural security *in freedom*. His people regard Him as the *absolute* Pharaoh; but his absoluteness involves the abolition of the Pharaoh in this world, the abolition of this world’s claim to absoluteness. In that aspect Judaism is a return to the Light-Essence. But because of the discovery of thought as absolutely negative, and of the Self as negative freedom, Judaism is a great advance into the *depths* of the “night” that enfolds the Light which it has returned to. The Jews were “preparing the place” for the Man of Sorrows just as the Greeks were “preparing the place” for his universal community.

Greek culture could never have produced the Man of Sorrows. He had to come from the world of the “Light-Essence”; and the Greeks had no concept of the *depth* of the Spirit as pure inwardness. We might perhaps hazard the guess that Hegel thought Abraham and Moses were less strictly “necessary” to the appearing of the Spirit than Homer and Sophocles. The Divine Man’s story would have come from somewhere in the world of the Sunrise, when it was needed (just as a prophet came from the Arabian desert nearly six centuries later). But this is only guesswork. Even if we think our guess about Hegel is good, we do not have to agree with him about the facts. The Science of Experience does not stand or fall by Hegel’s every reading of it (or mine). It is a quest for comprehension that involves *claims* about “historical necessity”; but the act of interpretation remains radically “free.”

In actual fact, Hegel seems to have held that the Jews were “necessary” to the appearing of the Spirit, because they are the original Unhappy Consciousness or the religion of self-rejection. It is certainly true that, because of their rejection of integration with the Gentiles, they were rejected by the Gentiles; and this meant that in the Roman Peace they were finally (though not for the first time) scattered. This *Diaspora* was functionally important for the spreading of the new universal Gospel; and the Gospel turned the Jewish experience of backsliding and repentance, into the doctrine of Original Sin as an inescapable “fate” of human freedom.

But to say that what was crucial for the early Christians in the Jewish tradition is definitive of the Jewish experience itself would simply be to make an arbitrary judgment *a priori*. The opposite judgment is equally possible. In the “thoughtful depth” of the Jewish experience, the universality of “reconciliation” is just as much implicit as the universality of “rejection.” If the impossibility of “justification” is vital to the Pauline conception of spiritual salvation, the Suffering Servant image is no less important to the Johannine conception of love; and in the circumstances of the Diaspora, how can we find any criterion for saying which was (or is) more important for the Jews themselves? They must be left to interpret their own tradition—whether in a Hegel-inspired way, like Franz Rosenzweig, or otherwise.

As for the Christian heritage, to say that the rejection of the natural world, and

the sublation of all dreams of natural happiness in the world, in favor of the “depth” of pure thought, was the highest moment reached in Judaism, does the Jewish tradition no dishonor; but to presume to decide that the sublation of the self, and of an earthly Messiah-King—which was logically required by that step—was simply *negative*, is a plain instance of “hardness of heart.” Faced with a forced option between the Pauline and the Johannine heritage from Judaism, the sincere Christian must side with John (and with the Second Isaiah). But the good Hegelian ought to say that the option itself is foolish, since both moments are necessary. By appearing to justify the Pauline view only, Hegel was implicitly supporting the thesis that the persecuted status of the Jews (in his own Christian world) was their own fault, because it expressed the righteousness of their own God. This is not the “truth” of his philosophy, any more than it is the “truth” of the Jew called Jesus of Nazareth. So Hegel’s claim that Judaism is the religion of simple *self-rejection* must be rejected as conceptually inadequate.⁴¹

Jewish “depth” is radically ambiguous, because it is abstractly immediate. Greek culture is immediate in another way. It lacks depth precisely because it sees the identity of the two opposites (the identity that Abraham and Moses so strenuously denied) and puts them together immediately. So the Greek “fate” has the tragic finality of a direct “contradiction.” The negative meaning of pure thought is immediately expressed in the positive freedom of artistic creation. The Greek expression of the divine in Art is a form of “absolute knowledge”; and because it is explicitly *self-knowledge*, it is the immediate existence of Spirit *as* Spirit, the first mode of knowledge that can be called “absolute” in a concrete sense. “The *essence* is *immediately unified with the self*.” God is here *incarnate* in his community for the first time.

- 23./721. The whole people, not just the artist, knows its individuality in God. The sun of Heaven has set in the satisfied life of a self-conscious *Volk*. Selfless nature sacrifices itself to a nature that is selflike: the Earth-Spirit flourishes with its feminine and masculine sides.

Because the community is self-consciously identical with its Gods, Hegel can legitimately say that in the abstract Cult of the Greeks “Self-Consciousness is satisfied in its essence.”⁴² Athena is incarnated in Athens; and the Earth-Mother and Daughter in the Hellenes. Zeus himself enters into his habitation (by the grace of Pheidias) at Olympia. This “habitation” is not now the temple and the statue, however, but the “place prepared” in the hearts of the people. Every initiate in the mystic Cult incarnates the Gods; but she does it, here and now, in actual flesh and blood. Pheidias incarnated the divine in the making of the statue; he was inspired. But the tension of that effort ends when Zeus sits enthroned at Olympia; worshipping in the temple Pheidias has the same contemplative experience as the rest of the community. That is the “Truth” made possible by the creative “abstraction” of the work of art out of the routine of life. Now, in the new moment, everyone issues forth from the temple to make their devotion count in their lives (just as Pheidias did in his workshop, before the statue was there to contemplate). This is the

pathos—the “suffering” of the “Light” that is now contained in the dark Temple of their inward selves. They return to their daily life “from the *Anschauung*, and from the *aufgehoben* objectivity” of their contemplative devotion.

Hegel explains (or, if you prefer, he develops) his metaphor of the “night of the Substance” by saying that it is “the divine light of the Dawn that has *set* within itself, and has Self-Consciousness (its *sunset*) within itself, and hence it has [finite] being [*Dasein*] and actuality.” The inward realm of the self remains unexplored, unilluminated; it is a “place prepared,” but it is still dark. The self has *Dasein*, it is there for itself in the world of daylight; it can act and be actual. But it is still dark (like the inwardness of the stone statue) until it expresses itself through the activity of the body, and becomes visible to the senses. To be is not to be perceived (as *Dasein*), but *sich vorstellen*, to make oneself perceptible in an image. The Living Work of Art is human life as “playing for the Gods.” The Gods now assume the spectator role of the Self as “the Other,” the role that was played by the worshippers in the Abstract Work of Art. The self-conscious structure is that of “equal recognition”; and for this reason the moment of Observing Reason is inverted but preserved by the alternation of the roles. Reason now *finds* itself as the self-producing of finite being and actuality. The fact that the stance of Observation is conserved transforms the finite *Gestalt* of Self-Actualizing Reason which is the moment here determined.

What is shown forth, *manifested* like an intelligible force of nature, or revealed to the self as its “self” is not yet the self as Spirit (absolute self-creation “from nothing”), but the natural self in its free self-expression as a physical agent. The Gods have given the people their daily bread and wine; the people now display to the Gods what can be made of that gift. It is the Earth-Spirit, or Dionysus and the Mother and Daughter of Eleusis, who come to their perfect shape of free expression at this stage. Zeus and the Olympians must wait, still, for the artist and the people to come together in the highest *kind* of “play”—the *drama*—as the final consummation. Even the Daughter’s consort, Hades himself, must wait; for “the living work of art” is a celebration of *life* not a reconciliation with death; and Hades, as the brother of Zeus, is Pluto, the last of the Olympian Twelve.

This is the moment of natural Life raised into its religious absoluteness—the peaceful “plant-religion” at its moment of self-conscious perfection. The principle of free self-assertion (which is masculine in its finite context, but not in the “darkness” of the home, or in the religious Daylight of the Spirit, as any objective observer of the Olympian Twelve can see) is here in both of its sexual shapes, moving blindly towards its death and resurrection. Dionysus, the masculine spirit of the “natural fermentation” that Hegel refers to here, is as much a destroyer of life as an enhancer of it.

- 24./722. Thus the enjoyment of the sacrifice reveals the meaning of the mystery. God and his world are for our enjoyment. The secret only needs to be recognized and proclaimed.

The mystery of the Sunrise at dawn (and implicitly the first mystery of the resurrection of the Spirit) is just the “knowledge” that all animal life has, and which

only some forms of human ascetic piety and moral theory have forgotten—that life is to be *enjoyed*. The mystic banquet of Eleusis (unlike the purely symbolic scrap and sip to which it is reduced in the Eucharist) makes this statement plainly. It is the Christian sacrament of the Bread and Wine that conceals its meaning, and is a “mystery” in that sense. The preachers of the Beautiful Soul theology claim that the secret is “manifest to Reason and to the heart.” But in all the verbal flood of their piety, it is still a secret because it is not lived out by anyone except Julius and Lucinde. The mystic sacrament of Eleusis, on the other hand, is a full and concrete act of life-enjoyment. The Aristophanic Dionysus can smell the roast pork; and we know that his own contribution to the festivities will flow freely.⁴³ It is in the celebration of the Mysteries that the abstract work of art *comes to life*; and the gift of Bacchus is the main agent of its release in the “darkness” of subconscious existence.

25./723. What has to be recognized is the many faceted force of life. This is Bacchic ecstasy.

Light and darkness are naturally necessary to each other. Finite Consciousness (and Self-Consciousness) is a “light shining in the darkness.” This darkness does not “comprehend it”; but it can be comprehended by it, for as the “night of the Self,” it is the unrealized potential of Reason. The light of Life must become the light of subjectivity and comprehend the darkness of Nature; that is what the Greeks got right. The identity of the “universal light” with “life” in all of its particular variety, is spoken of in the first chapter of John. But the identity of spiritual life with natural life is not spoken of; on the contrary, it is implicitly denied.

Hegel expects us to pick up this implicit echo of the Christian Gospel by ourselves, and there are three explicit echoes of other moments within the Science of Experience itself. The first is an evocation of the marriage-syllogism as the actual balance of the Ethical Order in paragraph 463. Like Plato, Hegel seems to have believed that wine brings the unconscious forces of instinct into the light of consciousness. That is why the cult of Dionysus is associated with the Goddesses of Nature. The “*woman's* syllogism” (the “upward movement of the law of the Underworld to the actuality of the daylight and to conscious thereness” [par. 463]) is recalled here as the “movement upwards out of its night-like buriedness into consciousness.” But this is one side of the total syllogism of the marriage bond; so the “*simple essence*” here is the Ethical Order as the object of identification in feeling.

The second echo is both further away and closer at hand. We have to understand the “mysteries of the bread and wine” as the Greeks did (par. 109). The “*inspiration*” of wine, in particular, teaches us that the life of nature *generates* the light into which it comes; and that the return of natural life to the darkness of instinct (and to death) is essential to that generative activity. The fermentation of the pressed grape and the drinking of the wine is here presented by Hegel as a *Vorstellung* of this mystery. In drinking the wine the celebrant becomes possessed by the God; but in the same measure the Spirit (masculine “I” and feminine “We”) descends from self-consciousness into the darkness of subconscious animal existence. The cult of Bacchus is the Plant and Animal-Religion in its fulfilled (or reconciled) shape.

The third echo is both the furthest away and the most direct. Hegel calls the Bacchic dance-troupe “the untamed revel [*Taumel*] of life in self-conscious form.” When he turns back to write the Preface he will say that Truth itself “is the Bacchic revel in which there is no member that is not drunk” (par. 47). This makes it very clear that the *self-conscious* character of the group is important; for Hegel does not want to identify Truth with the “dark night in which all the cows are black” (par. 16). Drunkenness is not a normal condition of “self-consciousness.” But the drunkenness of this “revel” has been freely chosen, and deliberately embarked upon. The full horror of the tragedy in the *Bacchae* of Euripides springs from the fact that Queen Agave has clashed consciously and violently with her son Pentheus about her adherence to the new God, before she and her troop kill him in their transported condition of enthusiasm. Here, the Sphinx takes her revenge upon Oedipus. The memory of *this* “sacrifice” (and of its self-conscious context) is essential to the contrast that Hegel makes with the Christian sacrament in paragraph 724.

- 26./724. But it is only the secret of spirit as Nature, only the living self of family life that is so far revealed. Finite spirit must still sacrifice its self-consciousness for its resurrection as Absolute Spirit [the *tragic* life-play for the Olympians, and beyond that the mystery of the Passion].

What has been revealed so far is still only “the absolute spirit that is this simple essence”—i.e. the essence of the *polis* as a community of natural kinship, the community whose “element” is the Family, and whose “simple essence” is the double movement of the “syllogism of marriage” (pars. 460, 463). It is the Eleusinian mystery of the bread and wine that is revealed, not yet the mystery of the flesh and blood. That higher mystery, too, will be celebrated and tragically revealed in the Art-Religion. Its revelation involves the deliberate and willing acceptance of death by the natural self-consciousness. But at present, this natural self is only preserving its own health and integrity by its voluntary surrender to self-forgetfulness in the subconscious darkness of animal existence.

Spirit recognizes itself *as Spirit* in the epic, and in tragic drama. Here natural life is not lived, but *portrayed* as a free sacrifice of self-conscious individuality “for the Gods.” This linguistic representation of the meaning of human life is the Greek Eucharist, the open “mystery of the flesh and blood.” In the epic, and the tragic drama, we have the finite life of the human heroes resurrected “absolutely” (or as Spirit) in the spiritual independence of a work of art which exists for everyone who will learn the *language* of this people and its Gods. The artist expresses spirit *as* spirit, the actuality that must “make itself” in order to *be* at all; and the medium she uses is the one of which we must all be master in order to be human spirit at all. It is only thanks to this “mystery of the flesh and blood” that we can properly comprehend the “mystery of the bread and wine.” Without Aristophanes and Euripides we would be almost helpless here. The “Bacchic revel” is the

essence of Truth, at its very “simplest”; but we no longer celebrate this “mystery” of “pure enthusiasm” ourselves.⁴⁴

- 27./725. The unstable revel of life must be stabilized as a living human “object.” Man can celebrate his service of God, although God cannot be completely incarnated in finite life. The *processions* are the democratic-universal aspect of this. But victory in the Games is the artistic level of expression for it.

In the “enthusiasm” of drunkenness, we experience the “infinity” of the “pure Ego.” But this must be inverted into the experience of self-control. Drunkenness cannot literally be the meaning of life for the self-consciousness that surrenders to it. It can be recognized as necessary and hence “divine.” But the imperative of Pentheus (in the *Bacchae*) cannot finally be lost. He perishes as a moment, because in seeking to assert that Reason is “the whole,” he is ready to deny that “enthusiasm” is a moment of life at all. But the assertion that “Truth is the Bacchanalian revel” does say *more* than the converse form “The Bacchanalian revel is truth.” So it is the proper way to express what Pentheus failed to grasp. “Truth” is the Bacchanalian revel that fully comprehends itself. It is the *Bacchae* of Euripides rather than the *Bacchae* of Dionysus.

It can only become this comprehended wholeness, however, by regaining self-possession gradually. In the very first step the wild dance must become a disciplined physical activity that is self-consciously controlled by its devotion to the Gods. But, of course, no control of the body can be *identical* with the divine—at best, the living body can only stand in for the God, in the abstract way in which the statue does. Thus, Zeus presides over the great Games held in his honor every four years at Olympia in Elis. Here the victors in the contests, being physically their own work of art, are celebrated and honored in the way that the Athenians would not allow Pheidias to honor himself or be honored. The first universal calendar that the Greeks possessed was based on the recorded names of those who won the foot-race at Olympia. But they were mortals who died in their time; and their names were soon reduced to numbers.

To be an Olympic victor was certainly a privileged relation to Zeus. But the Games (and all festivals that involved processions, beginning already with the Eleusinian Mysteries) were democratic celebrations of our human devotion to the Gods. Anyone can be a torch-bearer, as Hegel says; and Sophocles was only fifteen when he led the chorus that greeted the Athenian contingent—Aeschylus among them—returning victorious from the battle of Salamis.

Of course, we would not know these facts if Aeschylus and Sophocles had not done divine service of another kind. The religion of art is the expression of an *aristocratic* ethics. We do not know the names of the sculptors who carved the Panathenaic Procession for us (in the Parthenon frieze) any more than we know the names of their ordinary Athenian models. But we know the name of Pheidias; and the Greek calendar began as it did because the names of the Olympic victors were carved in stone. The living victor was crowned with the God’s wreath and given a

civic reception, just as our great sporting victors still are. In this respect, the “absolute Religion” has already repossessed its phenomenology perfectly.⁴⁵

- 28./726. Neither Bacchic ecstasy nor self-celebration in the Games is a balanced relation of recognition. The two must be united in one. The medium for this unity is speech. *Literary* art is where man self-consciously expresses the meaning of his devotion as embracing the whole of his human being; so it is the dramatic festivals that are the full expression of this religion. But the victorious athlete is the moment of transition from nature to universal humanity.

The Bacchic enthusiasm incarnates life as transcending the self. The victorious athlete incarnates the Spirit in its finite living movement. But the Games directly invert “enthusiasm” by exalting the singular embodiment of life above the universal continuum that sustains it. Only in *language* does the relation between the inward universal significance and the outward singular agent become perfectly balanced. There were poetic contests at Olympia, so the displaying of the Art-Religion was as continuous in historic reality, as it is in Hegel’s scientific exposition. Just as the institution of sacrifice, and the Eleusinian Mysteries enabled him to pass from the “abstract” work of art to the “living” work of art, without a break, so the Olympic Games enable him to pass from the “living” work to the “spiritual” work in an unbroken flow in which the philosophical discussion simply portrays the actual world of consciousness. Nowhere is our “observation” more purely contemplative than here.

In making the transition to language as the *spiritual* medium for the aesthetic expression of the divine, it is important to see what the differences are between the linguistic forms of worship that we have already encountered and the linguistic form of the Spirit. For the Oracle (which is the linguistic expression of the divine in natural religion) the distinction is easy. On the one side, those who come to the Oracle have specific and contingent problems; while on the other, the God expresses *himself* spontaneously, in proverbial aphorisms such as “Know thyself” and “Nothing too much.” But the inequality of the *sides* is patent. Whether it is given to *all* or to *this one*, the Oracle belongs to the God and only to him (as Oedipus finds to his cost).

Also, although Hegel does not remark on this here, the language of the priestess at Delphi is the same delirious babble as that in which Dionysus manifests himself through his dancers. In order to be responsive to the needs of the petitioners, the God’s utterances need to be interpreted; while his proverbial wisdom comes from the first recognized philosophers (the Seven Wise Men) and has received the divine stamp of approval through those same interpreters. The mediating third is essential.

In what he says about the “Hymn” it is clear that Hegel wants to make the continuum perfect. On one side, the continuum with the epic songs, to which we are about to pass, is obvious. It is the difference, or inequality, that is subtle. The Hymn belongs to the God and to all of his worshippers together, but to no one in particular. It is biographical (it deals with the God and his deeds); and if humans

are involved, their position is that of patients. They receive rewards and punishments. The Epic too, belongs to everybody, but there are *human* heroes. The War (or the Return of the Heroes) is fought out on two levels, and both are equally essential. It is clear that the Gods can achieve nothing without the devotion of the warriors on the plain of Troy itself.

On the other side, Hegel conceives of the hymn as originating in a spontaneous outpouring of the natural feelings of the worshipping community. It “remains at the level of feeling.” All that distinguishes it from the babble of the Pythia is that we know what it means directly, so that we can enter into it immediately, without the need of an interpreter. We sing it with the emotions that the words themselves signify and generate.⁴⁶

The strangest thing Hegel says about the Hymn is that it “praises only the singular God.” We might say as much about some of the Choral Odes in tragedy; but if we react like that we shall miss the point. When the literary artists turn their attention from the Gods to the human heroes of epic and tragedy, the action becomes completely “singular”; but the theme is now the *universal* spirit of humanity, not some *specific* aspect of human nature, such as the metal-working of Hephaestus or the hunting prowess of Artemis. We can see the transition in the Olympic victor. He wins glory for his City, and receives honor from his fellow citizens; but in emptying his nature out to the last ounce, he becomes a universally human figure.

The language of “the spiritual work of Art” has a content that is both *clear* and *universal*. “Clarity” is another quality that distinguishes it from the Hymn. For what Hegel means by this clarity, is that the symbolic and allegorical aspect of myth is overcome. The action of the story is human, and takes place in human terms. Heroes may suffer hallucinations like Ajax, and heroines may become frantic like Phaedra. But they know they are responsible for what they do.

The *universality* of the content springs from this “clarity” in which the human agent knows herself to be the only agent of the divine powers. Zeus sits enthroned at Olympia as the universal father both of the Greeks and of their Gods. At the Games, the Greeks were all brothers; the Olympic victor is the “universal man.” His own City honors him because all Greeks recognize this. The athlete forms a counterpart to the Beautiful Soul; he is the absolute Spirit poured out into a beautiful body.⁴⁷

In the Games, the masculine principle of “struggling for recognition” is harmonized into its naturally self-reconciled form. Those who are vanquished survive to applaud, to learn from, and be inspired by the victor—and perhaps to be victors themselves next time. In the Bacchant, Self-Consciousness freely subordinates itself to, and submerges itself in, the natural life-process. That is the “feminine” cycle of natural spirit—the tragedy in which the mother kills her son, the king. In the athletic victor we have the masculine cycle. Instead of spiritual self-loss in the body, we have the self-affirmation of the Spirit as free in the body.

But like the spiritual affirmation of natural death in the Crucifixion, this affirmation of natural life is the “emptying” of the spirit; it is one shape of what theo-

logians call God's *kenosis*. The athlete's victory is implicitly tragic because it is for this moment only. He is the "honor" of his City; but his victory is mute. It does not say what it signifies. "For itself" it is just a moment of glory, and it must pass away to make room for the next moment. Only the moment that can express itself in language can triumph over this emptiness by displaying what it means; and in doing that it triumphs over the transience of nature and the body. It becomes the properly substantial expression of Spirit. Zeus and his Olympian kindred can have their own heavenly kingdom (instead of a few days of strenuous existence at Olympia) in the Spiritual Work of Art; and in that apotheosis, they cease to be just the Gods of one *Volk* and become the Spirit of universal humanity.

It is much easier to identify the "circle" of this phase of the Art-Religion than it was in the case of the Abstract Work. The determining moment of Self-Consciousness is "Recognition"; and the reference is to the proper concept of "equal recognition" (pars. 179–181) not to the "experience" of unequal recognition that is crucial for the singular consciousness. At the level of Consciousness, we have a second moment of "Perception" where subjective sensation and objective being are in perfect agreement. Similarly, in Reason there is a perfect correspondence of Virtue and Custom (instead of the decadence of "the World's Way"); and in "True Spirit" we have an Ethical Action that expresses the Ethical Order without breaching it. Thus, in summary, we have

Perception: the Thing intuited in its Ground

Equal Recognition (a) Enthusiasm

(b) Bodily discipline

The beautiful fighter (Warfare in reconciled shape)

(c) The Judgment of Recognition (reconciled in the coming Syllogism of linguistic expression)

Rational Virtue maintaining Custom (compare par. 390—we can now see why this "aside" was needed)

Ethical Action: The Syllogism of Marriage (reconciling Divine and Human Law)

VII B(c): The Spiritual Work of Art

This is the stage at which the Olympian Gods achieve their proper prominence. (The Living Work of Art was divided equally between them and the gods of the Earth and the Underworld.)

There are three moments in Poetry and Drama as religious experience: Epic (the moment of the Volk as universal); Tragedy (the moment of the City and the Hero(ine) as particular); Comedy (the moment of the individual who is consciously Universal as a particular being—i.e. the appearing of the Concrete Universal).

As "spiritual" the work of art is distinct, but not "abstract." It is enjoyed universally, and it preserves its universal independence of meaning. But it contains and expresses the

whole of life. The Abstract Work expresses the whole symbolically; and in the Living Work we make our own bodily activities and exertions into a symbol of our devotion to the whole as particulars. But now we intuitively experience (and participate in) the life of the whole.

(f) *Epic Universality*

- 29./727. When the particular animal gods unite communally we have a pantheon that exists in the human element of language. The Greek peoples achieve their *universal humanity* in their common language when they undertake the Trojan War together. They are an ethical community, but not a political one. Everyone has immediate trust in his own *Volk*, and all participate in its decisions. This participation has to be set aside for the duration of the communal effort of the war.

The Olympian religion has its principal foundation in Homer (and secondarily in Hesiod). Herodotus—who says various dialectically conflicting things about Greek religion—says, in one place, that Homer and Hesiod created the “theogony” of the Greeks.⁴⁸ Actually, the “creation of the Gods” is a complex process in the evolution of communal consciousness. Thus, in the transition from naïve Understanding to “natural” (i.e. intuitively self-conscious) Reason,⁴⁹ it is the recognition of natural need and of the social structure that satisfies the need, which determines what Gods there are (as the necessary functional aspects of Life). Every “natural” community has a Mother Goddess; and those who have a War-God typically have a distinct Sex Goddess also; and so on.

But every natural community that manages to survive absorbs other communities; and when that absorption is by coalescence through free and equal mutual recognition, a different reason for the multiplication of the Gods comes into play. There has to be a communally shared religious structure for coalescence through recognition to happen at all; for it is at the level of “worshipping the same Gods” that intercommunal “recognition” takes place. Tribal communities whose ways of life, of subsistence, and of worship, are quite different must regard one another as “different animals”—especially when their differing relation to the environment encourages or necessitates conflict. But those who meet their needs in similar ways (hunter-gatherers or nomadic herdsmen in the same territory; agriculturalists farming the same soil etc.) can readily learn from one another, so that they “realize” their cultural identity before they “recognize” it.

This is the painless “flowing together of animal *Volksgeister* into one Spirit.” To unite warrior communities “freely” on the basis of this cultural recognition is the work of a *hero*. Hegel understood the political achievement of Theseus in Attica in this way from the first.⁵⁰ The common worship of the Olympians—and probably the hostile threat of the invading Dorians, who thought of their leaders as the “children of Heracles”—was a necessary presupposition for any such “political” achievement.

Long after the work of the heroes was done, there came the poetic genius who made the story of the Siege of Troy and the “wrath of Achilles” into the common

heritage of all who spoke the language, and worshipped the Twelve. Hegel seems to have accepted F. A. Wolf's view of Homer in a fairly strong form. The *Iliad* is the product of the communal genius of the Greek people. Many voices contributed to it. Some *one* bard (surely?) impressed upon it the unity of the "Wrath" theme. But the topic of the great collaborative war-expedition is the heritage of a many-voiced oral tradition; and the ethical ideal of life embodied in the heroes is that of a real society which has inherited this tradition. The bards (and their inspiring "Homer" whether he be myth or reality) portrayed this ideal, and made it more effective, by making it permanently present. Thanks to Homer the Greeks could never forget they were a family, however passionately they (and their divine models) might fight among themselves. But they were a family of independent communities. The "immortality" of the Gods pictured the immortality that was proper to the communities. The unity of the national family is a unity of natural feeling (and hence of religion); it is not the *made* unity of a political constitution. The Achaean community in Homer exists in the shape in which Athens probably existed even before Theseus appeared; and the model had a powerful religious import and validity for the community of completely political communities which came together to fight the Great King of Persia.

This community of "cities" is the community of True Spirit. Hegel is describing a family of fully political communities when he defines the *Sittlichkeit* of the "actual *Volksgeist*" as resting partly on religious feeling ("the immediate trust of the single [members] in the whole of their *Volk*") and partly on political practice ("the immediate participation of all, regardless of the diversity of their estates, in the decisions and actions of the government"). Each "single" member of the "whole *Volk*" will be a member of her "individual" community; but the move from the hymns of communal "identity" to the heroism of tragedy raises *religious* consciousness to the recognition that all of the cities are *Greek* cities, and the heroes are *human* heroes. Aeschylus can even set a tragedy in the *Persian* court.

Hegel's insistence on universal *participation* should not be taken simply in its Athenian democratic sense. It does certainly suggest the working superiority of the Athenian model; but even in Periclean Athens the opposition was politically alienated; they wanted a reform of the constitution which would recognize the variety of "estates." Hegel, like Plato, agreed that some mediation of participation was necessary.⁵¹ Like Aristotle, he holds that "citizens" must be "participants," but that they can participate in different degrees, and in a variety of ways.

In the Homeric situation, the "immediacy of participation" applies only to the heroic princes. In the politics of wartime, even at its most mature, only "trust" is effective; when Thersites speaks up for "democracy" in Homer, he is roughly handled. But every community had to participate "individually" in the resistance to Persia, just as the princes do in Homer. The Athenian "Empire" sublated this "individuality" (which the princes, with their powerful self-will, mythically portray). In the Epic every hero is the incarnation of his *particular Volk*, just as the Olympic victor is. Achilles and the Myrmidons are one and the same.⁵² This is the thread of logical continuity in Hegel's portrayal of how the Art-Religion "appears."

- 30./728. The life of the Gods portrays this situation. They are the substances of what their self-conscious (human) community is and does. To begin with, this essential unity is concealed under a friendly but external relation of Gods and Men. By this means the divine essence will return from substance into self-consciousness.

The assembly of the Gods on Olympus (in Homer) portrays this political situation in its primitive form, because "trust" is the foundation of participation, and religion, in this world of True Spirit, is the self-conscious awareness of "trust." The natural communities are "ethically obedient" to their Princes. Through the Olympian religion, this general pattern is extended to the natural environment. The Olympians govern the whole order of natural necessity, as well as incarnating the order of natural ethics. Their own society is one of "ethical obedience." The *Oberbefehl* of Zeus and Agamemnon (as contrasted with the *Oberherrschaft* of Ra and the Pharaoh) expresses itself in human terms as the "unwritten law," by which all political decrees and decisions ought to be bounded and constrained. The Spartans established *Herrschaft* over the Messenians; and because they had to live always, thereafter, with the clear awareness of what *Herrschaft* meant, and what it cost, they were not tempted to transgress the ethical limits of *Befehl* in their relations with their allies (as the Athenians did).

The "self-conscious essence" of which Hegel speaks is the political freedom of the individual community. The cities are self-consciously independent; every community goes its own way and defines its own constitution. They have different constitutions; and all of them have considerable populations in various forms of servitude. Thus, "ethical freedom" does not mean the same as Kantian moral freedom at all; but the Olympians as tutelary deities of the different cities are the religious Substance towards which the bond of absolute commitment and trust is felt. We must not make the mistake of supposing that only the free population shared in this "substantial trust." No one expected a serf to die for his loyalties; but serfs are praised and blamed (in Epic and Tragedy) for showing or not showing the "virtue" appropriate to their station; and the foundation of that "virtue" was even more obviously *loyalty* in the case of the bondsmen, than it was in the case of the free agents.

Without ethical loyalty the Gods would be impotent, because this is the source of their *Kraft*. Hence Achilles must somehow be persuaded to put his wrath aside; something must be done to heal his injured pride (without a new injury to the pride and authority of Agamemnon). Similarly, Zeus must bring his warring household to agreement. Each of the Gods has her favorites; and the virtues of the free man (especially the warrior) do not all harmonize readily under the supreme purpose of ethical trust and loyalty. Achilles would not be the great warrior that everyone recognizes him to be, without the proud temper that can brook no insult (even from his commander). Every hero has at least one of the Olympians on his side; and the multiplicity of virtues which this poetic image expresses, seems often to involve only the most contingent connections. The favor of Aphrodite is the simplest instance here, because the sort of gift that she can confer is so easily turned to

unethical uses. The war would never have started if her favor to Paris had not enabled him to seduce Helen.

We have to think about the Olympians in this *ethical* way, if we are to understand

the return of the divine essence into self-consciousness . . . which already contains the reason [*Grund*] why it [self-consciousness] forms the midpoint for those divine forces, and conceals the essential unity [of the divine and the human essence, or of substance and self-consciousness] for the moment, under the form of a friendly external connection of the two worlds.

The *unity* that is hidden by the poetic fiction of the Gods on Olympus is the ethical unity of self-consciousness, or the political ground of all virtue. This buried unity of God and man is the first stage in the return of the divine essence into humanity. The next stage will be the explicit assertion of “what the *self-conscious* essence *in itself* is and does.” At that stage the natural ethics of Antigone (represented by the Stoics) will be an illusion, the unwritten law will be the “law of the stronger,” and loyal commitment will be the “folly” that Thrasymachus declares it to be. For the moment it is Aphrodite who is, as always, wayward; and Paris and Helen are the deluded ones.

- 31./729. The artistic consciousness that expresses this relation thinks in images and creates Epic as the first linguistic medium for universal truth. The bard experiences this universe as *memory*, and his Muse sings directly through him. Through the heroes of the *Volk* the Bard is linked with the universal community of the Gods—the epic syllogism.

The “universality” of this religion of art is that of linguistic *Vorstellung*. “Set forth” (*vorgestellt*) in language the Epic Universal is the universal background (or the canvas, so to speak) of an imagined world. The poet *sings*, just as the community does in its Hymn; but she is creating a world of memory, not proclaiming the present glory of a god. This *Vorstellung*, or “exposition,” is defined by Hegel as “the synthetic tying-together of self-conscious and external *Dasein*.” Hector and Achilles are not ourselves; even for the schoolchildren of Periclean Athens they were very different beings “back then” in Homer’s account. But the account is in words; and those words have their being as meanings in the mind of the reader or reciter, whether it be the Athenian schoolchild, or the modern student of a translation.

But Hegel does not want to introduce a *written text* into his portrayal of the Art-Religion. He wants us to go back into the preliterate experience of those who heard the bards (and the illiterate experience of the mass audience for the dramas). At its “spiritual” level the Art-Religion was all “representation.” The bard was obviously a highly trained and skilled person—we can take the *Ion* of Plato as our paradigm, since Hegel was certainly familiar with him. *Ion* has learned his craft *by* reciting. He does not have books, or accept the concept of an authoritative text. He has good days and bad days; but on his good days “Homer” is in him; the audience can feel

it, because they are carried away too. When Apollo's Pythia speaks, the hearers are not carried away themselves; they can only watch in wonder, and some fear, as the priestess is transported out of their ken. But where the bard goes, they go too; his world is their world, brought back from far away and long ago by a divine power. The bard forgets himself, and they forget him and themselves. The moment of Bacchic "enthusiasm" returns in a perfectly human and "equal" shape.

The so-called "Homeric problem" has no meaning for the actual experience of "Homer" as folk-poetry. What matters is *this* song, *this* experience; we cannot even say "this *performance*" until we are reflecting upon it afterwards. For from a religious point of view, this song, sung now by this bard, is an experience of the Gods, through the recalling of the heroes. The song is about the heroes, and what they did, not about what the Gods did (or do). But it does seem to be about both parties, because it represents both in the same way, though in different worlds. The Gods, however, are "free universals." They are untouched by what they do or suffer. The heroes, though they become universals—for they live again in the universal medium of language—are *determinate*; they are bound and defined by what they do. They belong to this saga—not to every saga, like the Gods.

At this point, we need to inject a note on logical structure. Hegel speaks of the experience of Epic poetry as a "syllogism." The universal world of the Gods is linked with the particular world of human action through the singular inspiration of the bard (his Muse). The truly singular agent (the bard himself) disappears in the total experience (just as singular agency disappears everywhere in the Ethical Substance. But the bard no longer disappears into the unconsciousness of Nature, like the Bacchant. Rational human singularity is in the process of being formed.

This Epic syllogism of the "two worlds" is the first term of a "syllogism of development," which goes from the universality of the divine and human worlds to the conscious singularity of the comic actor, through the particular experience of the tragic hero in relation to a specific God; and when we comprehend *that* larger syllogism, the Epic syllogism itself will be seen as the Concept of the Ethical Order, which moves through the Judgment of Tragedy and Comedy, to the humanly universal Syllogism of the Manifest Religion.

- 32./730. Thus the epic *displays* what happens implicitly in the Cult. The peace of the Earth with its dead, is disturbed in order that they may be resurrected [*Odyssey* XI]. In the action the heroic leaders are the self-conscious aspect and the Gods are the substantial aspect. Because of their external relation in the imagination everything that happens is over-determined; both sides do the same things. The Gods are superfluous since they must act through the men. But humanly the losers at least are wasting their efforts (and the winners are needlessly anxious). Mortals both defy the Gods, and give them their actuality; but these seeming puppets on Olympus are also the natural stuff that is being fought over, and the ethical passions that motivate the fight. Win or lose the Immortals abide in their place, while the heroes *all* die.

Hegel uses one of the most remarkable adventures of the wily Odysseus (in the epic of the "Return") to express the action of the Bard. Odysseus himself belongs

to the older world of natural religion and ritual magic. He fed the shades with whom he wished to converse, upon a blood-sacrifice, so that they could return to life and speech. Ion does not need any natural means of this kind. His action is the purely spiritual activity of self-consciousness. He recites, and the peace of the Underworld is violated forthwith. "The departed spirits, thirsting for life, receive it in the act of self-consciousness," not in the natural mystery of flesh and blood. But of course the Bard does devote his whole being (as mortally finite flesh and blood) to his craft of resurrection.

This action of the Bard—"the essence that is conscious of itself"—"disturbs the peace of the substance and arouses the essence through which its simplicity is divided, and is opened up [*aufgeschlossen*] into the manifold world of the natural and ethical forces." Thus, what divides the substance into the natural and ethical orders is self-conscious Reason. Before the dawn of the Art-Religion, there was only the "order of nature." Humanity had some practical understanding of this order, but there was no awareness yet that it was to be used for the creation of an ethical order of free self-expression. Odysseus himself does not do his natural magic with any such consciousness.

The opening up of this division (between the natural and the ethical) creates a paradox, because the ethical order still has the natural order as its "substance." On the one hand, the human world (being spiritual) must make itself; while, on the other hand, since it is naturally substantial, it must be eternal. The paradox is imaginatively presented as a "*synthetic* tying together of the Universal and the Singular." In other words, the meaning is universal, but it is embodied in singular shapes; and the paradox of being both spiritual and natural at once, becomes two worlds that are put side by side "synthetically."

In each world "individuals" (i.e. not "singulars" but "universal-singulars," or "concrete universals") are the agents. The Gods appear to be agents, although they cannot really act, because they are not properly singular self-consciousnesses at all. They are the specific shapes of the Universal (i.e. they are logically Particulars, not Singulars). All they can do is what the true singulars—the mortal human heroes and their warrior-bands—do.⁵³ The Gods get their "individuality" only from the logical character of *Vorstellung*, in which a singular image represents a universal concept. In the poet's account, they are angry, they weep, or they fall about in uncontrollable laughter (an excess which Plato found particularly scandalous).⁵⁴ But all of this emotion is quite laughable in itself (rather than scandalous) we might say, because the Gods are in full charge of what the mortals do, and they cannot do anything except through the mortals. Also why should they be emotional about the outcome of the struggle since they are the Gods of both sides equally? (Why should Zeus weep, as he does, for the downfall and dishonor of Hector?)

On the human side, Hector and Andromache dramatize the tragic futility of carrying on the fight when you know that the Gods are against you. Hector knows that his resistance is doomed. Men must do the heroic things; but it is the Gods alone who dispose of their projects.

If we move to the other Epic, however, we can easily recognize, in the wily Odys-

seus, the ephemeral mortal who is “at the same time the mighty *Self* who brings the universal essences into subjection, injures the Gods, and procures for them in general, their actuality and an interest in the action.” With its concentration on a single figure, who loses his crew, and regains his kingship almost singlehanded, the *Odyssey* prefigures the final triumph of human “individuality.” But we must be careful here, for at this stage we are still witnessing the *birth* of the Ethical Substance; and what Hegel says is that “the ephemeral mortals” (collectively) “are at the same time the mighty *Self*.” Hence, we should go back to the case of Achilles and notice that his *wrath* “injures the Gods, and brings their essences into subjection.”

On the Trojan side, and more obvious still, there is Paris, who put himself forward to choose between the Goddesses, and set off the whole story by his choice of Aphrodite (in preference to the political wisdom of Athena, or the family guardianship of Hera). Achilles and Paris are the models that we need; here “the Gods” can be recognized as the dominating *passions* that drive “natural selves.” In the light of these examples, Odysseus can be recognized as the *single* “Self who brings the universal essences into subjection” because he has his passions under control. He is not the plaything of any spiritual *pathos*, but only of the forces of nature, and specifically of the sea; what is crucial is that he is not yet the single self who asserts himself *against* the social substance. The ethical unity of the Substance (the virtue of Zeus as king) is his guiding star.

- 33./731. Just as the Gods get into a contradictory relation with mortals, so their universal status comes into conflict with their specific character. They present the comic spectacle of fighting over things that don't matter, in spite of the fact that they cannot really hurt each other, or enter each other's proper spheres. They triumph over mortals, but their own struggles are either a joke, or reveal that they are finite selves subject to fate; and the universal self [of philosophical thought] hovers over them as a blind fate.

The philosophical inadequacy of paganism, which accounts for the eventual triumph of Christianity, can be summed up by saying that the Gods both are, and yet cannot be, “true selves.” They are ethical ideals of nature harmonized in beauty; but the living human nature that generates them remains obstinately selfish and self-willed (both meanings are probably contained in Hegel's *selbstisch*, but the second is more important, because a “nature” that is “selflike” is one that has *selfhood* as its goal, not some other contingent desire).

The Gods are the universal “elasticity” of life. They are ethical motives that never perish. But their “elementary natures” are “brought into actuality and into activated relationship by the free self of individuality” (par. 730). What is displayed by the conflict between “universality” and “particularity” in the divine natures, is the untruth of the claim that the *polis* is a “complete and self-sufficient” whole. Within the “ethical individual” (i.e. the heroic leader) these “elemental natures” appear as the self-willed passion (or *pathos*) that reveals the presence of some particular Immortal. So the opposition between “ethics” and “nature” is a contradiction within the Gods themselves.

The Gods are bound to quarrel. One might think that the devotion of Hippolytus to Artemis was so complete as to make him safe from harm or wrong.⁵⁵ But Euripides shows us that his obsession with hunting is connected with his hatred of Aphrodite, who motivates adultery, and so makes nobly ambitious young men like himself *bastards*. When Phaedra's secret is revealed to him, his puritanical reaction is so violent that she believes suicide by itself will not suffice to keep her secret. Hence she explains her suicide with a lie that is credible to Theseus (who has no unnatural antipathy for Aphrodite); and Artemis keeps the peace of Olympus by sacrificing her votary. Hippolytus dies at her hands, as well as Poseidon's, because he has the devoted hunter's confidence that he can control his horses.

Euripides does not let the Gods themselves quarrel. But Artemis has to suffer loss, in order that Aphrodite may triumph over all. In Homer, of course, the Gods behave like wilful children; and the spectacle is, as Hegel says, *comic*. Plato found it scandalous; but from the perspective of the modern era, we can see that it was tragic. It is for this reason that Hegel here introduces the "invincible divine force" of the fate against which not even Zeus can fight. But he means us to linger with the comic aspect first.

The first aspect of this divine comedy is that because their "*determinacy* is rooted in their divine permanence, and has in its bounding, the independence of the whole individuality" the characters and actions of the Gods become just as ambiguous as those of human agents. They are immortally independent individuals. So Artemis cannot always be as faithful to her hunting, and her chastity, as Hippolytus was to his. There is a great hunter, Orion, with whom she falls in love; and her brother Apollo has to remove him smartly from the scene with an arrow.

More disastrous—for this is where the shadow of Necessity arises—is the fact that all the freedom of life is reduced to *play*. The shadow of death broods unacknowledged over the whole world of free self-expression. When the City finally exists, there is nothing serious left to do. This is reflected in the pointlessness of Olympian existence. Zeus and Hera are the best paradigms here. The king of the Gods, and the very god of kingship, has nothing to do but seduce mortal women; and the Goddess of wedlock and legitimate birth exists in perpetual jealousy. Even the girl-chasing and the jealousy are pointless, because the stories refer to that "always" which is "once upon a time," i.e. a long time ago. *Wesen ist was gewesen ist*, everything essential has already happened.

When the Gods act like free individuals, and are not bounded by their determinate character, then "the *pure force* of the *negative* confronts that independent security, and as its ultimate power too, over which they have no control." This only makes sense if we take the "pure force of the negative" in two opposite ways. What the Gods have no control over is the historic process that leads to the demise of the Cities, the establishment of the Empire, and the final emergence of a universal religion of the God who died as a man in radical disharmony with all natural ethics. This whole process is just something that happens incomprehensibly. The Gods "behave to it as [beings] without a self, and are in mourning." This grieving of a self that knows itself not to be a self is the paradoxical condition of the "Unhappy

Consciousness"; and the long slow death of "paganism" is part of the Unhappy Consciousness of the World-Spirit. The "purity" in which "these *determinate* natures do not find themselves" is the "purity" of the Christian devotion which accepts the loss of this present world and of its life in the world.

So far the interpretation is relatively easy. But now we must attend to the fact that this incomprehensible "happening," this "*conceptless void of Necessity*" is the "*pure force* of the *Negative*," the "ultimate might" of the "independent security" of the "whole individuality." This "pure force" and "ultimate might" is clearly the negativity of *thought*. That is why the incomprehensible fate that "hovers over [the Gods], and over this whole world of *Vorstellung*" is the "*universal Self*." Just how does this *pure force* of thought hover over the Greek gods? That is what *we* can observe, and the pagan worshippers cannot. For them what happens is incomprehensible and "conceptless"; but we must comprehend it.

The answer is quite simple. Inside the Epic the Gods are "the universal and positive as against the *singular self* of the mortal [worshipper]." But the universal self that "hovers over them" and endows them with the "independent security" of the "whole individuality"—so that their actions as individuals contradict their "*determinate* natures"—is the poet (*in primis* the communal poetic faculty of the bards, and of the preliterate community that generated the myths originally). The whole world of these Immortals is a "world of *Vorstellung*." The capacity of humans to present an ideal to themselves is the first stage, but only the first, in the evolution of the distinctively human capacity for thinking. Thus the "might" that looms over the world of individuated beauty is its very own might, the evolving power of the thought that created it.

How the evolution of consciousness will proceed we already know. The first stage is the emergence of the Roman Emperor, a singular self who is master of the world; he is both a living God, and the universal self who is supreme arbiter regarding the admission of other Gods to the universal pantheon. But this situation is contradictory. The truth of the Roman World is that all the Gods have gone to the Egyptian Realm of the Dead; and the Universal Self must be resurrected from there as spirit proper. It must return to itself as the Reason that comprehends itself as the self-constituting and self-interpreting process of universal human experience, founded in the rational community as its substance, but embodied in individual self-consciousness, so as to achieve itself as subject. This whole cycle of self-comprehension is God incarnate as Spirit.

- 34./732. This necessity is the unity of the Concept. The active *middle term* in the poetic world is Achilles. Actual singularity is split into two moments and banished to the extremes: abstract Necessity and the actual singular Bard. Neither is involved with the hero. Necessity must enter into the story, and the hero must speak in the poet's words.

Having recognized the two-sidedness of "Necessity"—as historic *fate*, and as the logical evolution of pure thinking beyond the level of *Vorstellung*—we can see how Hegel can call it "the *unity of the Concept*" immediately after saying that it is experienced as "the *conceptless Void*." What is important at this juncture is that we

know how and where this unity of the Concept is present in the world of *Vorstellung*. It is the Bard to whom “the contradictory substantiality of the singular moments is in subjection.” When we read that through this subjection, “the inconsistency and fortuitousness of the agency [of the separate moments—i.e. the Gods] comes to order, and the play of their actions receives in the actions themselves its seriousness and value,” we ought to think of the bards for whom the Homeric canon is already established. The popular imagination—the primitive identity of Mnemosyne—which finds a dryad in every oak, and a nymph in every stream, creates contradictions certainly, but no easily detectable order. But the Bard who besought the Muse “*Wrath sing, Goddess, of Peleus’ Son Achilles,*” and made all the traditional lays fall into place (almost!) round the quarrel of the High King with his best warrior, was no run of the mill community storyteller.

This epic poet—unique and original genius as he undoubtedly was—himself disappears in his theme. His world “plays its motion, set free on its own account, in the *middle*.”⁵⁶ The middle of the epic motion is Achilles son of Peleus, who is named in the very first line; and the quarrel itself, which is the “content” in motion, is the topic of the first book. The “content” of the motion is the Wrath of Achilles, which is resolved finally when he surrenders Hector’s body to Priam. The hero is a tragic figure *in expectation*, since he knows that he will die young. But the epic does not arrive at this moment of personal completion.

It is obviously significant that Hegel speaks of Achilles as an *Individualität*, but of the actual bard as “the *within itself fixed and actual Einzelheit*.” Achilles in his Wrath is permanently individualized. The “singularity” of his creator has two sides: the *abstract* one of Necessity (i.e. the uncomprehended contingently singular Fate of the hero in the story); and the concrete or actual one, which Hegel himself identifies as “the speech of the bard.” The Bard as the composer, is the fate-determining “Necessity” of his song; but also he is the external narrator whose voice brings the epic world into being. Achilles does not bring his fate upon himself, so “Necessity” is not part of his life; and the Bard does not take the life of Achilles upon himself. These two “extremes” (the artist’s singular story, and his own activity as a singular agent) must “draw near to the content.”

What this means with respect to the “speech of the Bard” is plain enough. The Epic must become *drama*; the hero(ine) must speak and act for herself. What Hegel means by saying that “Necessity has to fill itself [or fulfil itself] with the content” is a bit less obvious because it is two-sided. On the one hand, the hero(ine) must make her own fate, not someone else’s, and not as the result of something as fortuitous as an insult giving rise to wrath; but on the other hand, the *Vorstellung*, the “story,” must become the content that fulfils the “necessity” of logical thought. These two requirements are one and the same, because when a *self-made* destiny replaces the blind necessity of fate, the transition cannot happen unless the audience is thoughtfully aware of it. Even if the tragic hero (or the Chorus) thinks aloud for us, we must recognize that she is thinking truly; and if there is anything fortuitous about the hero’s fate, we shall not (or ought not to) agree with what is claimed.⁵⁷

(g) *Tragic Particularity*

- 35./733. Thus we arrive at Tragedy. Here the Concept realizes its syllogistic moments in active shapes. The hero speaks for himself, and unlike us, he is a linguistic artist who can say what he knows. We are now the observers of an *action*; and if we abstract from that [by reading] we admit that Art does not yet contain the authentic *self*.

Since the Art-Religion itself exists as the created world of *Vorstellung*, the approach of Singularity to the content (the divine life) begins from the side of language. The language of the bards becomes the dramatic self-expression of the hero in Tragedy. The world of the singular consciousness is that of action; this is to be “brought closer to the essential world.” So the “essential world” of the divine substance goes apart into its *shapes*. One would have thought that this had already happened in the divine family on Olympus. But that family is just the universal shape of the undivided “Substance”; a spiritual substance is necessarily a community. The decidedly quarrelsome and often inconsistent council on Homer’s Olympus is just the *Vorstellung* of a Concept at rest. The conceptual moments of Universality, Particularity, and Singularity must be united in the concrete Individuality that returns directly to Universality because it knows itself to be universal. The stability of this circle is what the Olympian Family surveying the Epic battlefield artistically represents. This resting Concept must now pass into a Judgment. It must divide into the radically antithetical sides of an action in which the hero is face to face with some specific God. We already know what the structure of tragic action is because we have encountered it (as an aesthetic *Vorstellung*) in the Ethical Action of the real world of True Spirit. In that perfectly developed shape the confrontation is completely personified. But now we shall be looking not at the content of one Sophoclean Tragedy, but at the *form* of Tragedy generally.

The hero speaks for himself; so the audience have become viewers, and not simply hearers. Moreover, the hero is *self-conscious*, he is identical with the poet, and can define his own specific aim and his rights, he knows who he is, and he can *say* what he wants.

Hegel is very emphatic and detailed about this. Tragic heroes, he says, are artists who can use language to express their inner nature; its *specific* aspect is constituted by its *pathos*, the passionately felt limitation that determines the direction of the heroic action. This is contrasted with the superficiality of what we know and say about ourselves in ordinary life; and with the fortuitous character of the circumstances that determine our actions. We can see the relevance of Hegel’s comments even with respect to the Epic hero. The story of the Wrath is the story of how Achilles learns to be a hero, and so comes to tragic maturity. He does not know who he is when he is insulted, and the *pathos* of Wrath reduces him to inaction. A genuinely tragic action begins when Patroclus borrows his armour; but even in his mistreatment of Hector’s body Achilles is still learning how to be a hero. His lesson makes great drama; but it is not typical of Greek tragedy. Odysseus is closer to the self-knowledge that Hegel ascribes to the hero. But again, the story of Odysseus is not typically tragic; and his *pathos* in the conflict with Poseidon is external.

Tragedies have to be acted; and whereas the successful Bard disappears—for we become unconscious of his person if we are fully enchanted by his song—the successful actor is the focus of all eyes. The epic song can seem like a divine gift of inspiration (indeed, that is precisely what Plato's *Ion* claims it is); but just as we know that the statue was made blow by blow with mallet and chisel, so we are even more vividly aware that the drama is being humanly produced before our eyes. If a good play is not well acted, we may distinguish between the quality of the performance and the quality of the play itself; or we can still *read* a play. But then we have to be very much aware of its “make-believe” aspect. When we listen to the Bard, we “forget” both him and ourselves in the created reality of the epic world. But when we read the play, the “performance” only becomes unnecessary because we ourselves become the Bard. We must now be aware that the authentic “self” is our own, and that it is not in the play.

We have still to understand the logic of this progression from Epic to Tragedy as an “experience.” Hegel's description of what happens as “the extremes coming closer to the content” or “the essential and active worlds coming nearer together” does not sound like a methodical progression by inversion. But that is what it is for both of the “extremes.” On the one hand, the poet's part is “inverted” from that of “universal creator” into that of singular actual hero; and the epic World as a sublated “experience” provides the raw material for this new artistic venture. On the other side, our world of the inner imagination as we listen is inverted into this external performance that we are watching; and our capacity to appreciate the hero's deeper self-knowledge and self-making depends on our familiarity with the Epic tradition too. This last point Hegel will now comment on.

- 36./734. The world is still that of the Epic. The Chorus expresses the wisdom of the *Volk*; but it must do as it is told by the King. Lacking the negative power (of thought) it has to praise all the Gods in their turn. When it does espy how badly things go with the Gods, it recognizes only an alien Fate, and experiences the emotions of pity and fear [Aristotle, *Poetics*]. It is submissive.

In the new Concept, the experience of the Epic World survives in a sublated shape as the Chorus. They watch what happens, and lead us, the audience, into the right ethical understanding of it. Thus the ordinary consciousness of the *Volk*, the audience both for the bard and for the drama, is brought before our eyes as a necessary moment of the audio-visual presentation. They are the moment of Universality, the Concept which is to observe and suffer its own split into a Judgment. The “individuality” of the *Volk* is still their King, just as in Homer. But he is the Government, not a war leader or ship-captain far from home. Hegel's characterization of the Chorus as the “*universal soil* upon which the movement . . . proceeds” is important, because it shows us how to generalize his theory from the paradigm cases of the *Oedipus Tyrannus* and *Antigone* (which he uses here again, just as he did in chapter VI). It fits his view perfectly, for instance, that Deianira (in the *Women of Trachis*) should have a chorus of the local women. This directs our attention to the fact that the tragedy is based in family life—and Heracles, for once, is a patient of

action. Antigone, who takes the initiative in the male world, has a chorus of scandalized elders, to underline both her sex, and her youthful status. The Furies themselves form the Chorus of the *Eumenides*.⁵⁸

Hegel is certainly somewhat unjust to the Sophoclean chorus of Elders when he says that "lacking the might of the negative it cannot hold together and discipline the riches and the varied abundance of the divine life." The Sophoclean Chorus *thinks* as well as anyone in the drama, and often better than the heroic agents. The heroes sometimes derive their clear self-knowledge from the Chorus; so we must allow that Hegel's contrast is a bit overdrawn.⁵⁹ But, of course, *no one* in the world of *Vorstellung* has "the might of the negative" in the way that the poet (and we ourselves) have it; and it belongs to the essence of the artistic *form* to let the specifications of the Concept (the Gods) go their ways, with all the inevitable conflicts and inconsistencies of their individuated natures.⁶⁰

Hegel's claim that the traditional wisdom of the Chorus is helpless in the situations where the "Concept marches forward trampling the [Olympian] shapes into fragments" is certainly true of the two Sophoclean tragedies that interest him most. Apollo's dealings with Oedipus are denounced by the latter in a heartrending protest; and Antigone's last long speech ends with a challenge that the Chorus has failed to meet—a challenge to the justice of Zeus which leaves the rationality of her own loyalty to the Unwritten Law in doubt.⁶¹ In the present state of the record we could also appeal to the *Prometheus Bound* of Aeschylus as a clear case; but I doubt whether this appeal would be justified if we had the whole of the Prometheus trilogy. Euripides I have not studied adequately. The *Trojan Women* may be a good case; but by dramatizing the Homeric image of the two worlds, and letting the Gods speak on high "from the machine" he makes them the recognized mouth-pieces of the conceptual advance. So they are not "shattered" by it, but *sublated*.⁶²

I am not sure that the Sophoclean chorus *ever* takes refuge behind "the empty wish for peace of mind, and feeble talk of the calming of the storm." It does often urge resignation, and its religious function is to portray reconciliation; and in the last choral dialogue with Antigone, it does, perhaps, come fairly near to deserving the more extreme reproach levelled here. But that is the only case I can find. The Chorus of the *Oedipus Tyrannus* responds with firm opposition to Jocasta; and that of the *Oedipus Coloneus* is quite resolute in its conventional stance (but, of course, it only needs to be obedient).

Hegel applies Aristotle's doctrine in his own way when he ascribes purgation through pity and fear to the chorus.⁶³ What they are *fearful* of is, first, the *Dike* of the public and the private worlds; secondly of the conflict between them; and ultimately of the breakdown of the substantial constitution into the arbitrary subjectivity of the "law of the stronger." At any rate, these are the "rational fears" identified by Hegel's "science of experience," and made explicit in the *Antigone*. We can also find some clear cases where the Chorus recognizes a "Necessity" against which even the Gods are powerless; and in their response to Jocasta's blasphemy against the truth of oracles, they show clearly why we must support the Gods as best we can against the emergence of that "Necessity."⁶⁴

We do not need to be preoccupied about whether the Chorus fears Necessity as “alien fate” (as in the sack of Troy at the end of the *Trojan Women*) or as the “simple self.” Troy perishes by fire; but its women go to a life of servitude under the same “simple self” who burned their City. It is not Descartes’ *thinker* who is the “simple self” in Hegel’s *Phenomenology*. The really “simple self” is an incomprehensible “fate,” because it does not comprehend *itself* at all—it just acts to satisfy desire; and, as the case of Achilles illustrates, its “desires” are impulses that take consciousness by surprise.

- 37./735. Spirit appears to this audience as the simple splitting of the Concept: protagonist and antagonist display the Justice of Zeus to an audience represented on stage themselves [cf. Antigone].

In commenting on paragraph 733 I said that the Concept divides into the sides of an “action” in which the hero faces some specific God. I was thinking not just of Orestes and the Furies, but of Oedipus whose real antagonist is Apollo. But Hegel chooses to concentrate on the most completely developed “shape” of the tragic conflict. Here two different “divine powers” face one another embodied, in a human protagonist and antagonist. The division of the Epic Concept into a Judgment takes place before the eyes of a Choral Concept-consciousness. In the *Antigone* the two sides of the justice of Zeus are fully incarnated in the human agents. The King of the Gods assumes his logical role as the ideal unity of the sides. Antigone and Creon identify quite simply with the Divine and the Human Law; and the dramatic medium makes it possible for the “universal individualization” to have its *Dasein* in two flesh and blood actors.

In the *Eumenides*, the same judgment is put before us, except that the dramatic Chorus has to play a double role. They have Antigone’s part as well as their own,⁶⁵ and the part of Orestes is doubled by Apollo: Athena herself is the justice of Zeus; and the Furies, as Chorus proper, confirm its triumph. Athena, of course, is doubled by the silent vote of the human court. So the whole situation is portrayed Homerically; and in the happy resolution of the conflict we see the Concept at rest.

But the *Phenomenology* requires the Concept in motion. That is what we see in Sophocles, where the resolution is through the triumph of natural necessity in the shape of death. Like those who see Eteocles and Polyneices kill one another, we have to learn the lesson thoughtfully, i.e. at a higher level of conscious reflection. The audience in the theatre can, of course, supply the wisdom of Athena; that is what Sophocles himself intended. When the Chorus condemns “proud arguments” (*megaloï logoi*) at the end, they mean Antigone’s arguments, rather than Creon’s; after all the play is not *his* tragedy, just because he lives on after a loss which Antigone dies rather than accept.

But this splitting of the Concept as Law is properly the tragedy of finite Spirit. It is not the reconciliation of Family and City that is the absolute religious problem, but the reconciliation of Spirit with Nature (or of the free human community with the order of natural necessity). That is the problem of Oedipus rather than

Antigone; and we shall shortly see how Hegel does now offer a broader perspective upon it.

- 38./736. We have already dealt with the content (in *True Spirit*). The Gods are reduced to the two laws (human and divine). The dispersal of the Gods [in Epic] is the dissolution of the subject into moments of substance; now it is gathering itself, and a greater variety of characters is superfluous.

Religion is the “pure” consciousness of the Substance of Spirit, of which we are objectively conscious as the social structure of our way of life. This social substance is the logical and real foundation of our selfhood. We are, of course, living “subjects” by nature; but that “nature” is a blind urge, which achieves selfhood only in some social situation or other. So the logical minimum for “self-consciousness” is the recognition of one’s self in some blind or half-blind urge for self-expression.

The Art-Religion is the “pure consciousness” of the City as a free community of tribes and families. “Freedom” inheres in the decisions of the community, not in those of singular agents. It is only in council that these human animals become rational; but consciousness is the achievement of the singular subject, so the “freedom” of the community has to be embodied in singular consciousness. Hence the “pure” consciousness of the community requires either a political self-identification or a family self-identification. The first is religiously mandated for males, the second for females. The holy Thing is in both cases the Community; but on one side it is seen as the achievement of freedom, and on the other as the law of nature.

The Greek Tragic Drama evolved in the context of certain great religious festivals, beginning with the chorus, and adding progressively one, two, three (and finally in Euripides four) singular speaking agents. Hegel is showing here why the Aeschylean minimum of two actors was essential. *Two* divine powers must present themselves before the Chorus, the power of Nature and the power of Freedom. This was necessary to the Drama as a religious institution; beyond this any additional means were mere “utilities” the disposal of which was determined by the practical problems of presentation. Offstage events must be reported by messenger, and the social context of the antagonists must be indicated somehow. But the essentially religious purpose dictated a rigorous economy of means; everyone must be able to see clearly where the tragic conflict (i.e. the religious problem) was.

- 39./737. The substance is also divided with respect to knowledge and ignorance. The agent’s *character* [male, female] determines his/her [ethical] knowledge. The other power remains hidden. What is known [by the male hero] is the daylight side of Apollo and Zeus. But it is full of traps. The riddle guesser Oedipus and the simple hearted Orestes both come to grief. The Delphic priestess, and the witches inciting crime in Macbeth are the same power, and both speak with forked tongue. Hamlet therefore does not trust the voice, for even if it is his father’s it could still be the devil.

Certainly not every important Greek Tragedy can be brought under Hegel’s model of a conflict between the two laws. But a conflict between private and public

“ethical relations” can be found in many of them.⁶⁶ The most general problem that Hegel recognizes in Greek Tragedy—the religious, as opposed to the political, problem—is that of “ethical knowledge.” Apollo, the God of Light, the Sun that shines in the human intelligence, and gives the human law the absolute sanction of Reason, is also the oracular God of Delphi. He has conquered the Great Snake of the Earth-Mother, and his priestess carries the title “Pythia” in memory of that. But the Oracle keeps the Earth-Mother’s secrets, and gives clear directions only regarding the good of the community.⁶⁷

In view of what Hegel has already told us (in par. 712) about the “indifference” of oracular knowledge in the *ethical* world, it is obvious that we must interpret what he says about Delphi, and about the “knowledge” and “ignorance” of ethical agents, with care and circumspection. Everyone (man or woman) knows the ethical “law”; no one (man or woman) knows their own natural “fate” (or needs to know it). The first thing to note (after that) is that the power that is “shy of the light” (par. 469) is the Oracle. It is the Oracle, not the Sphinx, that deceives Oedipus here. The riddle of the Sphinx he solves; he knows that “Humanity” exists only in political freedom. It is precisely the answer to this riddle that requires male blindness to the natural dependence of aged parents, wife, and children upon the husband when the City requires his service.

As we already know, it is an ethical ignorance that Hegel is talking about. In the normal order of things, no one is ignorant of his ties of blood in the way that Oedipus was. That ignorance was put upon Oedipus by Apollo (through the first oracle to Laius). Equally, no woman (not even an alien like Medea) is empirically ignorant of the political obligations and loyalties of her father, husband, and brother. What determines ethical knowledge is the commitment called “trust.” In the ethical sense we know what we must be *loyal* to. Loyalty involves a necessary ethical blindness; and in that sense it is “ignorance.” So ethical knowledge is oracular, and deceitful because it is necessarily one-sided. Oedipus, the riddle-solver, is the most extreme of all possible cases of ethical ignorance; Antigone, who faces an outraged King, and the condemnation of the Chorus, knows her own one-sidedness as fully as possible. But both obey the “oracle” of Socrates, the oracle of their own sense of what must be done.

The individuals of Greek Tragedy are universal models of how the singular consciousness can or should identify itself with the whole. The hero(ine) takes her goal from her *character*. Her character is what is “ethically essential” to her; it is what she “knows.” The other side “lurks in ambush” because it is “ethically essential” also; but the ethical necessity is to ignore it.

Hegel says that both Oedipus and Orestes were “sent to ruin” by what Apollo revealed to them. This is clear enough in the case of Oedipus, who cries out against Apollo himself. In the case of Orestes, where Hegel is certainly depending on Aeschylus (as well as Sophocles),⁶⁸ we must examine the facts more closely. It was certainly Apollo who caused the Furies to be roused against Orestes; but Aeschylus presents him as supporting his suppliant firmly throughout. So it is an overstatement to say that Orestes was “sent to ruin” by the Oracle; but it is an overstatement

in any case, because he does not go to ruin in the end at all. Athena saves him. Hegel's point, therefore, must simply be that Apollo could not really protect him; and even that is not accurate, because it is the Oracle that sends Orestes to Athena. Hegel's comment is valid only for the condition of Orestes when he comes back to the Oracle for help at the beginning of the play. At that point his first appeal to Apollo had "brought him to ruin." He brings the Furies with him, of course; and the Pythia herself is terrified.⁶⁹

The Pythia, says Hegel, is nothing else but, or nothing other than, in no way different from, "the equivocating destiny-sisters" who deceived Macbeth. But there are some remarkable differences which this remark commands us to overlook. We can get over the shift from one prophetess to three without invoking Christian symbolism (a line of interpretation which is plainly outlawed by Hegel's *nichts anders als*) because the Greeks acknowledged Three Fates, and Shakespeare was plainly thinking of them. Furthermore, although Apollo refuses to acknowledge the Furies, and argues always from the public perspective, it is very plain that he knows *all* the aspects of the destiny that he brings upon Orestes; when Orestes returns to Delphi and is purified by Apollo, he is clearly warned that the Furies will still pursue him. So it is legitimate to identify the Pythia with the Three Fates together.

This does not mean, of course, that we must identify the "childlike trust" of Orestes with the criminally motivated superstition of Macbeth. When Hegel calls the "trust" of Orestes "childlike" he means to suggest that Orestes simply did not *see* that his action could be viewed in the morally critical way in which Euripides viewed it. The adjective indicates that Orestes did not *see* this, precisely because he did not have any non-ethical motive; he was just doing what custom required. The Pythia is "no way different from" the weird sisters, because they are both external authorities, blindly followed and not comprehended.

Hegel makes this point much clearer by bringing in the genuinely modern case of Hamlet. Hamlet faces exactly what Apollo threatened Orestes with: his father's ghost. But he is both more self-possessed (*besonnener*) and more deeply founded (*gründlicher*) than Orestes, because he knows that the oracular voice is within him—and that it may be just the voice of his personal ambition—or at least it is likely to be so interpreted.⁷⁰

- 40./738. Orestes must come to grief, since the "objective essence" counts as much as his knowledge. By converting knowledge into being, action brings forth its injustice, the Furies, who must be recognized alongside Zeus, god of Justice and Kingship.

Hamlet has passed beyond "trust" to the state of distrust, because he knows that he is caught in the antithesis between his certainty that he is the rightful successor to his father, and the objective essence which dictates first that he must not take the law into his own hands, and secondly (as in the case of Orestes) that he must not raise his hand against his mother. It may seem that Hegel wants us to ignore the problem of securing public recognition of what the new Aegisthus has done; but

that involves a distortion of Shakespeare, and of the objective difference between the naïve world of Orestes, in which the avenger simply acts, and proclaims his own justification afterwards, and the constitutional world in which justice must be demonstrated before it is executed. This change in the world is one aspect of the deeper grounding of Hamlet's consciousness, so it ought not to be ignored.

The naïve ethical consciousness (of Orestes on one side, and Antigone on the other) simply *knows* what justice requires, and knows that the burden of fulfilling justice falls directly upon it. This is, in reality, the pre-political attitude. Orestes is the case that Hegel is concerned about, because succession to the kingship through a killing is the crucial problem for the essentially political religion. Everyone knows that Aegisthus is not the rightful king; and everyone knows that Clytaemnestra killed her husband to keep Aegisthus on the throne. Hence Orestes must kill *her*; that is the justice of Zeus as proclaimed by his son, Apollo. There is nothing mysterious about this oracle; it is the age old law that the King-killer must die. This is the law of the Daylight, not of the darkness. But Orestes cannot kill his own mother without a pollution that is public and objective; no community can harbour a matricide. This is what the "childishly trusting" Orestes of Sophocles' *Electra* seems not to be aware of.

The Furies *are* public opinion (just as Hegel's theory of the Chorus claims); so the action of Orestes is inverted as soon as it is done. From being the duty of a prince towards the King, it becomes the appalling outrage of a son against his mother. Orestes saw one side at the bidding of Apollo; but every family in Argos sees the other side; and wherever Orestes goes it is the same. He is an object of religious horror. Apollo wants the Furies sent to Hell with the other spirits of the pre-political age of the Titans; but Athena (like her jurors) knows that the older Justice of the Underworld is just as important as that of Apollo. The Furies accept this verdict, and Orestes becomes merely the limit case, released because the votes are equal.⁷¹

- 41./739. So there are just *three* essential divine moments in Tragedy. Zeus is the unity of the substance, God of City and of Hearth alike. The God of Daylight [Apollo, Athena, Artemis etc.] and the Furies [Pluto, Persephone, Demeter] represent the known and the unknown law. The substance divides into its two sides as human agents. The substance has *two* sides; the agent's certainty depends on *forgetting* the one that destroys him.

Having dealt with the structure of the religious conflict in Tragedy in its explicitly political shape (Antigone, Oedipus, Orestes) Hegel now tells us how to generalize the theory so as to comprehend the whole range of tragic situations. Zeus is the unity of the ethical Substance—the God of Kingship and the Hearth. Antigone's "*Dike* that dwells with the Gods below" belongs to the justice of Zeus, just as much as Creon's *Dike* of the community. But Zeus, though he may be God of the Hearth, and guardian of all guest strangers who come to it, is an eternal disgrace as a husband. So there can be many tragedies where Hera's jealousy or anger represents the offended justice of the Underworld.

The appearance of the Gods in their own person (as in the *Eumenides*) is exceptional; Zeus and Hera must normally appear in the interaction of human champions. Take, for instance, Heracles and Deianira in the *Trachiniae* of Sophocles. Deianira has been deceived; she did not mean to subject Heracles to a torture from which death is the only release, but to ensure his return to her as his wife. The substantial identity of City and Family can only be represented through Zeus and Hera in amity together. It cannot be dramatically individualized in one alone. The Concept as Judgment requires a double *Gestalt*. The doubling is necessary because of the ethical ignorance created by identification with one's character as defined by custom. Tragic heroes know who they are, and can say it with perfect clarity, because their identity with the customary roles (which everyone "knows" in a linguistic sense) is absolutely definitive. Their "self-knowledge" is an absolutely solid and unhesitating identification with an "other" in which they intuitively recognize themselves.

Thus every tragic hero(ine) has a necessary ignorance as well as her knowledge; and the division between the Gods of Light and those of Darkness is only an abstraction. No tragic hero can simply incarnate Apollo or Artemis; and no heroine can incarnate Hera or Persephone (or Aphrodite). Apollo is the God of the Oracle that once belonged to the Earth-Mother. Hades himself is the brother of Zeus, and the Goddess of Childbirth is the Queen of Heaven. Aphrodite belongs in the marriage-bed, but there is no doubt of her presence in the market place; and so on. Athena's wisdom in the *Eumenides* exposes the abstraction perfectly; and Apollo only argues as he does, because human justice to Orestes requires it. Apollo executes the Justice of Zeus. He declares that every oracle he has given is in direct obedience to that.⁷² But Athena is the *wisdom* of Zeus; and she shows that Zeus is (as Hegel says) "the necessity of the *connecting* of the two with one another."

This "connection" is expressed in three ways: first, knowing is free and independent, it is the subjective consciousness of the hero; "but it has its truth in the simple," i.e. in the ethical substance (which has *no* consciousness except the contemplative observing one of the community). So as soon as the hero takes sides in action, his knowledge becomes ignorance, and his justice is revealed as a crime.

Secondly, "the distinction, through which actual consciousness subsists, has its ground in the inner essence that cancels it." The "distinction" is that of knowledge. This has its ground in the "inner essence" of the God who reveals the justice of Zeus as *one* of the two laws. That same God (who is only abstractly a God of Light, or of Darkness, of Heaven or of Earth, of ethical freedom, or of natural bonds) cancels the distinction. In the *Eumenides* it is actually Athena who cancels the distinction, which Apollo abstractly maintains; but the identity of Apollo with the Earth-Mother is declared in the Pythia's first speech. It is Zeus himself (or all the Gods together) who "cancels the distinction" for Antigone (as she acknowledges in her last long speech). The clearest case of "cancelling the distinction" that I can think of, however, is that of Artemis in Euripides' *Hippolytus*. Sadly, but inexorably, she sacrifices Hippolytus in justice to the offended Aphrodite.⁷³

Thirdly, "the *assurance* that is clear to itself, the assurance of *certainity*, has its confirmation in *forgetfulness*." This third form of the necessary relationship is not

just the first one over again; it is not the identity of active knowing with ignorance. Nor is it the identity of the God who reveals with the one who conceals. Rather, it is the reconciling form of the identity; “forgetfulness” confirms “ethical certainty” by functioning as the immediate (or aesthetic) shape of forgiveness. When the Furies accept Athena’s justice they must forget the offence of Orestes. Antigone (in the great speech that Hegel himself misinterprets) is offering to forget her immemorial right, if the City will forget her offence (and so maintain that right itself in future). The natural right of revenge must be *forgotten* if there is to be civic justice. The most fundamental case of all is that Oedipus must forget what Apollo did to him, and trust the God still, when he comes to the grove of the Furies at Colonus; and this he does, although he cherishes his family grudges to the very last. Ethical “forgetfulness” is as strictly practical as ethical knowledge (or “certainty”); it need not involve ordinary forgetting at all—and certainly it does not involve the forgiving of our human enemies.

- 42./740. Consciousness uncovered this antithesis through action. [Orestes and Antigone] followed one law and were brought to justice by the other one. Oracles clearly show why they are not to be trusted; and the truth that is ignored is always there in the open, easy to see. The truth that ignoring it reveals, is that both laws are equally right (or in their exclusiveness equally wrong). Lethe is the only resolution of conflict here—either civil oblivion or natural death. But the peaceful harmony of Athena’s settlement is the mask of Fate and Death.

Tragic action “unlocks” the antithesis of nature and freedom within human activity. In order to follow “nature” we must freely condemn our freedom as evil; in order to assert freedom, we must pretend that we have no nature. The myth says that the Oracle deceives the hero; but real deception requires an almost miraculous set of coincidences as in the story of Oedipus; and even then Jocasta was not “deceived.” The ethical commitment is accepted knowingly as necessary. Orestes knew quite well that he was killing his mother, just as Antigone knew she was burying a declared outlaw; and the guilt—i.e. the ethical knowledge—of what one does, is never “forgotten.”

The ambiguity of “forgetfulness” is important. The wisdom of Athena “forgets” the offence through a conscious civil decision; but an obstinate insistence on the ethical forgetting of the law transgressed, brings the ethical substance of both laws to destruction, and the heroine to the “forgetfulness” of death. “Ethical ignorance” is rational folly because the whole Truth of Spirit is clearly visible; and “ethical forgetting” must turn into the oblivion of natural death, because the harmony of the two laws involves the inaction both of the natural individual (on behalf of the Family) and of the government (for the *polis*). The Olympians can only disappear into the simple sovereignty of Zeus, when his Justice emerges as the almighty power of Fate.

- 43./741. This advent of Fate depopulates Olympus, because we can now see that the Gods are not real individuals. Greek philosophy begins here, but the lesson is anticipated in

Tragedy where we are brought to see that Zeus must embrace all the other Gods in himself; and that the necessary moments are human. In spite of the Chorus the unessential character of the other Gods is revealed; only the logical moments of universal and particular matter.

The “return of Apollo and the Furies” into the “simple Zeus” completes the “depopulation of Heaven.” The Gods are not agents; they are not even the spirits who inspire the action of the heroes.⁷⁴ It is the abstraction made by the hero(ine) that inspires her. Greek philosophy is the advent of thinking in the critical form that rejects the “individuality” of the Gods. Philosophical criticism of the Gods goes back to Xenophanes and Heracleitus at least; so it is actually older than the tragedians. But Hegel is thinking of Plato’s attack on Homer, and his banishment of the dramatic poets from the Ideal City. Homer deserves banishment, Hegel thinks, because he is guilty of a “thoughtless mingling of individuality and essence”; but the great tragedians are unjustly condemned, because their heroes are servants of the “simple Zeus.” Tragedy identifies the necessary logical moments of the simple unity. The division of the Substance (into Community and Family, Heaven and Underworld) is ruled by the philosophic concept. “Hence the individuality [of tragedy] is the essential one [unlike the “individuality” of the Gods in Homer], and the determinations [of substance and/or individuality] are the absolute characters.” These “absolute characters” both male (Orestes) and female (Antigone) are the self-consciousness that recognizes only the absolute divinity of the ethical substance: one and the same Zeus in the justice of Apollo, and the Justice that “dwells with the Gods below.” One Zeus alone is the God both of Kingship and of the Hearth; as the *necessary relation* between them he is the God of the Oath. And “in the antithesis of knowing [and ignoring]” Zeus alone is the “father of the knowing of the *particular* [i.e. the male or female hero] as it comes to shape.” The movement of the particular shape goes from Zeus the King to Zeus of the Hearth, or vice versa, and so discovers Zeus of the Oath as the “shape” comes to completion. Orestes and Antigone illustrate the opposite directions of necessary movement, as well as the fact that the “particular shape” may be that of a life or of a death.

But the moments to be reconciled can take many other abstract forms—as the Chorus (save only in the *Eumenides*) always reminds us. Thus Antigone dies for her ethical duty to a dead brother; that is her *ethical* “pathos.” The husband whom we see, and the son whom no one will ever see, sink down into *natural* passions. So we need not speak of ethical *pathos* in that connection; the German or English vernacular is good enough. But in other tragedies any of the ethical bonds—wife, husband, son, daughter, guest-friend, etc.—may achieve the dignity of an essential *pathos*. Thus Alcestis dies *for* her husband; children she has, and with proper ethical simplicity she prays for a good marriage for each of them. She asks her husband not to marry again and he promises not to; but we have been told before we ever see her that she does not expect this. In fact, he *does* marry again, but the mythical reconciliation is that the bride—a prisoner of war, fortunate to have the

status of wife at all—will be a *new* Alcestis, and not the “stepmother” of universal folk-tradition.⁷⁵

- 44./742. The Gods as aspects of Zeus, and the heroes as agents of the two laws, perish together in death. Tragedy makes Necessity emerge as the truly divine power; the Substance and Necessity coincide as the abstract negative force of self-conscious action. The *consciousness* of this belongs to the surviving observers, the chorus and the spectators (who experience pity and fear [as Aristotle says] for the human and divine aspects respectively). But all of it is only a *play* for their enjoyment anyway!

Death is the power that triumphs; and in the tragic defeat of both of the laws of the Ethical Substance, the Gods who personify the separateness of these laws perish also. Zeus in his simplicity has no voice, no consciousness; he is just the unconscious necessity of nature. Every finite consciousness knows that natural necessity as the limit called “mortality”; and Greek Tragedy culminates in the struggle of the two brothers who kill each other, and the struggle of Creon and Antigone about their equality in death. Self-Consciousness is shared between them (as it must be, if they are to be ethical agents at all). But it does not *mediate* itself. Athena persuading the Furies in the *Eumenides* is only a *Vorstellung*; neither of the parties in that collision is a mortal human agent.

But Creon, surviving as an impotent observer of the downfall—and the Chorus directing our attention to the fact that “proud arguments” do not become us mere mortals—both point to a further moral. The whole presentation of the ethical heroes in their relation with Zeus and his twofold justice is made for the mortal self-consciousness of the audience. Here, in the *conceptual* comprehension of the living audience for whom the whole show is put on, is the self-consciousness of Necessity, its free spiritual aspect; this is the real self-consciousness of “the simple Zeus.” Aristotle is right in saying that the audience must experience pity for the mortals who suffer, and fear of the immortal powers. The “fear” is evoked by the *alien* character of Necessity.⁷⁶ The Gods are not individuals like us, but a process of fate in whose grip we are helpless; and “compassion” (*Mitleid*) is what we experience because we are observers, not agents.

The agents have quite a different *pathos*. But this brings us to the final irony; there are no real tragic agents at all. It is all a “play,” a hypocritical pretence. The consciousness that is involved in the action is that of an “actor,” i.e., someone who creates the “imitation of an action” (as Aristotle put it in his definition of Tragedy). The true unifying of self, destiny and the ethical substance is not present here; we shall meet with this union only in the Providence of the Christians. Oedipus and Antigone are just masks put away until the next performance; the player goes home to a family of her own. So, in the Art-Religion, this hypocritical pretence must finally be presented honestly too.

- 45./743. The acting hero must take off his tragic mask and admit that he is both the “destiny” of the Gods, and an ordinary man like the Chorus.

We are now going to move on to the Old Comedy of Aristophanes as the “comprehensive inversion” of the Epic world and Tragedy. But—whether Hegel wanted us to or not—we can easily apply paragraph 743 to Euripides. For already in Euripides we observe a resolute refusal to treat any one passion as an ethical *pathos*. What distinguishes the real *pathos*, as I understand Hegel, is the hero’s conviction that *this* passion is a *determination by God*. The *pathos* is what is logically represented by the mask; that is why I interpreted Hegel’s remarks about “the self-scattering moments which the Chorus allows to count one after another” (par. 741) to mean only that the other passions (which the Chorus acknowledges to be divine) are not divinely validated for the particular hero(ine) of the tragedy at issue. Their validity for the Chorus means that they could each be the *pathos* of some other tragedy. Each of the “Gods of the Chorus” can become one of the two “absolute powers” (or even both of them at once).

But Euripides, though he certainly recognizes human nobility, does not concede that any passion is simply determined by an *ethical* imperative. His *Electra*, for example, is very clearly meant to be a moral valet’s commentary on the *Oresteia* of Aeschylus. Everyone has non-ethical motives, and everyone has an ethical defence for their position. The hero’s tragic mask has slipped badly, and Euripides lets the Gods themselves tell us that the heroes are, indeed, the “Fate” of the divine powers. The Euripidean *Electra*, however, is no comedy; it is a consciously *hypocritical* tragedy.

(h) *Comic Individuality*

46./744. *Comedy* is where this final transformation happens. Here the Gods are not selves, but simply the universal moments of selfhood. This secret is let out of the bag by an actor who is just like ourselves.

In the Old Comedy of Aristophanes all hypocrisy has fallen away. A God can come on the stage in his mask (as Dionysus does in the *Frogs*). But the mask is transparent; at no time does the character pretend to be anything but an ordinary man, whose like is to be found in every row of the audience. Dionysus in the *Frogs* is even further removed from the awful presence of the God in the *Bacchae*, than the “Socrates” of the *Clouds* is from the Socrates of the *Phaedo*.

Dionysus is the only God actually brought onto the stage by Aristophanes (in the plays that survive). He is the principal God of the dramatic festivals, and his project in the *Frogs* is to bring Aeschylus back from the Underworld, because he does not like what Euripides has done to Tragedy. This project fails. So does the quest for “Peace” in the comedy with that title (Peace is to be drawn up from a well). In the *Peace*, moreover, the main character engages in the religious cult of an enormous dung-beetle—an “Egyptian” fantasy on the part of Aristophanes. These are the best examples of the irony of comedy about “abstract moments” that pretend to be independent essences. The religious message of the *Clouds*—that Zeus is dethroned and the Whirlwind is King—is more tragic than ironic.

"The pompous pretence of the universal essentiality is betrayed in (and to) the Self." The word *verraten* here looks forward to the counter-betrayal of "the Self" by Judas. That other betrayal is also necessary, before the "universal essentiality" of God can be properly united with selfhood (or before Substance can become Subject). Jesus himself, the *absolutely* Beautiful Soul, is only a Self playing with the mask of divinity, as long as he is a flesh and blood person saying things like "I and the Father are one"; for this is just what the comedian is saying, when she lets the mask slip so that we can see her face, and recognize her as one of us. She is not a hero at all, not someone who incarnates a divine *pathos*; the only *pathos* left to her is that of being *honest*. She wants to be "something *recht*"; so even on the stage she must say to us "Look, it is really an ordinary (wo)man, behind the mask." But, since she is just an ordinary (wo)man "imprisoned in an actuality," this betrayal of the truth *in* her self and *to* us the audience, is only the disappearance of divinity from our world of experience.

As long as we take the "betrayal *an dem Selbst*" in this double sense (*in* her, and *to* us), however, we can see the higher truth in it. The "self" who is the "Fate" of the Gods is not just the Emperor. That is a comedy which turns soon enough into the bitterest tragedy: the Gods have flown from the Earth, and the religious consciousness is left forlorn. But in that forlorn world, there is a Self who can see how to portray the *thoughtful* identity of "the universal essentiality" as the actual identity of the community.

- 47./745. This resolution becomes more recklessly deliberate, when the subject of the play is serious. The sacrifice is already a comic ceremony, but Comedy recognizes the humor of it. [In Aristophanes' *Knights*] City and Family have openly collapsed into the character of *Demos*. Politicians fool him, but he is the boss, and there is nothing traditional about his policies.

We have to take *das Selbst* in this concretely universal way (accepting the actor as the interpreter of our communal situation) if we are to understand Hegel's characterization of the destiny of the Gods as a "general dissolution of the shaped essentiality generally in its individuality." Unless we take the stage *persona* as the universal interpreter of her community the actor is only an *Einzelinheit*. It was the actor's tragic mask that was an *Individualität* (because of the hero(ine)'s identification with her ethical *pathos*).

"This universal dissolution . . . becomes more serious in its content, and thereby more mischievous and more bitter, insofar as it has its more serious and more necessary significance." The truly serious and necessary significance of the religious drama is explained in the next sentence: "The divine substance unites within it the significance of the natural and ethical essentiality." On the side of Nature this "more necessary significance" directs our attention to the *Frogs* as a play about "the mystery of the bread and wine." But the serious aspect of that play was already obvious and we have, by now, discussed it enough, since we got our view of the Mysteries from it.

On the side of Spirit, the “ethical essentiality” is the political topic of Tragedy: the unity of family custom and public law. By his reference to the *Demos* (the vulgar community of ordinary folk, who constituted the “democracy” by voting upon everything they wanted to in the Assembly) Hegel himself directs our attention to Aristophanes’ *Knights*, in which *Demos* is the central character. But we should not forget the *Wasps*, where the Chorus is the Athenian *jury*; for jury-voting was the other great function of the *Demos*. There is also the *Acharnians*—in which a Megarian peasant is driven by the famine to try to sell his young daughters to the hero. This comedy deals quite “bitterly” with the private aspect of the “Ethical Substance.” The *Lysistrata*—where the women start a political revolution by refusing their marital obligations—belongs here too. Aristophanic comedy is “more serious in its content” here, because it is more realistic. It has real life as its content; and this “more serious” content is the real tragedy of the ethical substance—the War between Athens and Sparta. Whether it is *mutwilliger* (more sportive or mischievous) than the *Clouds* or the *Birds* (which last is a true fantasy) may be questioned; but there is no doubt of its greater *bitterness*.

Hegel characterizes the adventures of *Demos* in some detail. In the *Knights* (as also in the *Wasps*) the main target of Aristophanes’ attack was the democratic leader Cleon. Pericles managed to wrap himself in the tragic mantle of the hero (nowhere more obviously than in the great Funeral Oration that Thucydides gives him). But Aristophanes leaves poor Cleon no vestige of dignity at all; and we need to remember how the Aristophanic picture of Socrates compares with that of Plato, if we are not to lose our historical perspective regarding his political victim. Hegel’s concern is with the *representative* function of Comedy, so the historical justice of Aristophanes’ attack is not important to him. We should notice that, whereas the flesh and blood actor is the “individuality” of the divine essence, his mask (as *Demos*) is now called “the principle of [the people’s] singularity sundered from the universal.” The pattern of Tragedy—a mortal singular portraying a mortal (and hence tragic) individual—is now perfectly reversed: a mortal (and hence comic) individual portrays a logical “singular” (the “common man” or “the man in the street”). The same analysis applies to the *Acharnians*—where the central character portrays the ethical universal: he is Dicaeopolis, Mr. Just City. This hero is not unique like Lot in Sodom (for Aristophanes hoped to reach everyone); but he is just as much a helpless puppet of events.

On the other side, the Family-Singularity is *Lysistrata*, Mrs. Let-the-Army-Go-Home. Dicaeopolis and Lysistrata personify the singular intelligence as moral critic. The Sausage-Seller in the *Wasps* (Cleon, with his Chorus of Pensioners) represents those selfish purposes of the singular consciousness that have usurped control of the Commonwealth. Singularity has broken free in both ways, not just in one of them. The Ethical Substance has dissolved in moral criticism as well as in selfish exploitation; and the exploitation (at least) was always there. So we can hardly deny that the War has produced an advance in spiritual consciousness. Pericles has been dead only twenty years, but it is already clear that the Constitution he lauded is a contradiction between theory and practice.

- 48./746. Rational thinking destroys the conventional pieties of the Chorus. The Gods return to their natural aspect. They are the *Clouds* [of Aristophanes], the simple *thoughts* of values in philosophy. The sophists corrupt the youth and the wisdom of experience is a joke.

Aristophanes wrote his most famous play about the breakdown of the traditional ethics almost as soon as Pericles was dead. In the *Clouds* he presents us with an old peasant, Strepsiades, who goes to the school of Socrates to learn how to cheat his neighbors. Here the new “gods” of the scientific philosophers are presented to us as the *Clouds*. Since the *Clouds* are the Chorus of this comedy, it is clear that Hegel is *contrasting* the Comic Chorus with that of Tragedy when he speaks of the “conceptless wisdom of the [tragic] Chorus.” The *Clouds* (and their divine king the Cosmic Whirl) are precisely “concepts.” Strepsiades returns in the end to his peasant proverbs, and in our last sight of him, he is setting fire to the Socratic “Think Tank.” This is a prophecy of what the conceptual whirlwind will indeed produce. But Strepsiades is doing what his proverbial wisdom tells him to do; so his action reveals the revolutionary dialectic that was always there locked up in the proverbs.

When Hegel gives the *Clouds* a positive ethical significance as “the *simple* thoughts of the *Beautiful* and *Good*” he probably means us to remember the *Birds* as well as the *Clouds*. In the *Clouds* Socrates organizes a debate in which the Unjust Logos drives the Just Logos off of the stage. So the “Clouds” are “simple” only in Hegel’s own dialectical sense; simple Goodness and Beauty have gone to Cloud-cuckooland. Unlike the “simple *Idea*” portrayed in Tragedy—which must be *embodied* if it is to be an “Idea” at all (i.e. a unity of intuition and concept)—the “simple thought” is an immediate unity of *conceptual* opposites. The Unjust Logos is just as essential to the bare Concept of “the Good” as the Just Logos. It is the reference to “the Beautiful” that directs our attention to Cloudcuckooland; the Unjust Logos reigns on Earth because the “simple Ideas” (and the Olympians who incarnated them as intuitions) have gone back to Heaven.⁷⁷

The trial of Socrates for impiety is in Hegel’s mind too. The rule of the Unjust Logos in the real world is symbolized by the condemnation of the real Socrates twenty-five years later, for the sins of the stage Socrates. “The force of dialectical knowing abandons the determinate laws and maxims of action to the pleasure and lightmindedness of the youth led astray by it.” The primary reference of the sentence as a whole is to the plot of the play; but we ought not to miss the reference to the trial of the historic Socrates, and to his quest for ethical definitions. The “youth” referred to in *that* context is Alcibiades, and not just the nameless son of the Aristophanic Strepsiades. Socrates, son of Sophroniscus, is the “singular self” who was already walking the streets of Athens before Aristophanes put him on the stage as a mask. His actual conversations are the comic drama of “the Beautiful and Good” as pure thoughts; and he and Alcibiades show the range of “the play of the opinion and the caprice of the accidental individuality.” Nothing could convey the comprehensive inversion of the Homeric world more graphically than this use of the word “individuality.” For the chancy mortal consciousness has always been an *Einzelheit* till now; only the Gods on Olympus, their Cities, and the community–

leaders on the battlefield of life have been “individualities.” But Socrates can teach anyone—from slave-boys upwards—to think.

It is, perhaps, the accusers Meletus and Anytus (or Plato’s Anytus and Euthyphro) who express the traditional “determinacy” of the pure thoughts “as content.” We certainly have to choose someone who was actually subjected to Socratic dialectic (and Alcibiades does not appear as a victim in the dialogues accepted as genuine) because it is the Socratic elenchus that is “the absolute determinacy” of pure thought.

It is the philosophically reflective Understanding—the Understanding of chapter III—that is being born here. We are leaving “Spiritual Thinghood” behind. Like the Pharaoh, the “God” of this Understanding will be a finite human self. But he will now be consciously dissociated from the natural world. He will be the “mastering” power of human self-consciousness. For the present, we simply have the comic spectacle of the ordinary “vulgar” intellect, which knows perfectly well that there is nothing “divine” about it, but which has recognized itself as the maker of the Gods, and of human values. The “Socrates” of the *Clouds* is the Young Rameau of the Ethical Substance; and Unhappy Consciousness is the “inverted” shape of Comedy. The world, being deserted by the Gods, is “unhappy.” But for the moment the finite consciousness is completely happy and at home.

- 49./747. Thus through *Comedy* the previously blind might of Fate is united with the singular self. The Art-Religion culminates in the happy consciousness of man as a singular self creating and mastering everything. The hero of comedy is a man just like the actor and like us in the audience; so we all share the Happy Consciousness.

Aristophanes borrows Socrates directly from the real world for the stage; and Socrates is the universal interpreter of a new world, the world of the natural philosophers. In his own “conversion” (as described in the *Phaedo*) natural philosophy becomes ethical, and the quest for truth becomes a dialectic of pure thoughts. This is how the two aspects of Fate are united. Tragedy and Comedy give birth to Philosophy in its naturally mature form.

But it is crucially important that the historic Socrates is put to death. For it is the *singular* self, the mortal who goes to his death voluntarily and affirmatively, in whom the Gods disappear. In his pure thinking, the ideals that they represented, maintain themselves as Platonic Forms; so the religion of Art is fulfilled in him, and is completely returned into itself in him. The great document of this “return” is his inner dialogue with the Laws in the *Crito*; but the maintenance of the Self in this “nothingness,” so that it is not “the emptiness of the disappearance” is set forth as the great argument for immortality in the *Phaedo*. What that proof means, and just how the Socratic (or Platonic) “soul” can be immortal, is a long story, which we have still to traverse. But it is the realm of pure thinking, where everything is an eternal essence, and nothing is simply there in a natural way, that we have now passed over to.

We should notice that this *conceptual* analysis of the downfall of the Ethical Substance does not cohere with the claim that “womankind is the internal enemy” or

“the eternal irony of the community” (par. 475). Whatever insight there may be in that contention belongs to Hegel’s own social world, and to our own subsequent inversion of it. The theory of “True Spirit” in Hegel’s “Science” directs us to take “woman” there as Tragedy’s universal symbol for the Family; and the Family of True Spirit is as patriarchal as the City. Now that we have arrived at the level of Absolute Spirit, it is easy to see that the sexual contrast to which Hegel’s Science properly points is that between Xanthippe sent home before the serious conversation begins (in the *Phaedo*) and the part played by the Mater Dolorosa (and the other women) in the narratives of the Crucifixion and Resurrection.

The transition to Unhappy Consciousness lies still ahead of us. What has come to consciousness perfectly in Comedy is the universal “happiness” of Consciousness in the Art-Religion. The philosophers are the grave-diggers of this spirit; but just as the finitely natural self-consciousness ended in tragic unhappiness, so the naturally infinite self-consciousness ends in comic joy and laughter. The poet, the actors and the audience are not philosophers. They are all ordinary folk, who have recognized themselves as world-creators, and as the creators of the Gods. In this perspective, Comedy is the moment of perfect self-consciousness of what Art is. We have left the realm of the immediately natural self and entered that of *rational* self-certainty. Thinking is now recognized as the “absolute might”; God does not need to be embodied in a statue, in an athlete, or in a tragic hero presented to us in an imitative mode, as a model for our imitation. Nor do we need to forget ourselves, to lose ourselves in that union with nature experienced in the Mysteries, and portrayed so frighteningly in the *Bacchae*.

Socrates, therefore, is the appropriate hero for Comedy at its highest moment. He, who had absorbed even the Oracle into himself, wanted everyone, young and old, rich and poor, to join him in the new “cultivation of the soul.” They did not want to go with him; but it is through reflection upon his mission that we can best comprehend the *existential* truth of Hegel’s claims about the significance of the Old Comedy. Obviously, although the topic of the War was tragic and bitter, the audience went to the theatre to enjoy themselves. They knew what they were watching, but they laughed. Aristophanes has his bitter joke at Socrates’ expense, with justice. For Socrates certainly did not know that his dialectic, his care of the soul, was the final dissolution of the Ethical Substance.⁷⁸ For him, as much as for any of his fellow-citizens, the life of the City was the *enjoyment* of human nature to the full. His “examining of life” is the final expression and purpose of the Happy Consciousness which has executed the Gods (as substantial individualities) in order to worship not the Whirlwind, but the Beautiful, the True and the Good.⁷⁹

This final phase of the Art-Religion repeats the “syllogism” of Stoicism, Scepticism and Unhappy Consciousness. But each moment appears in its properly reconciled and infinite shape: the Stoic “freedom of thought” is the freedom of the Gods upon Olympus; the negative “suspense of judgment” (in Scepticism) is the tragic reconciliation of the hero with God as the positive “ethical individuality” of the Olympian shape (which itself only pretends to be a real individual); and the Unhappy Consciousness of Fate as the absolute Self, is the Happy Consciousness

of the Self who is the Fate of the Gods. This syllogism determines the total pattern of the circle as follows:

Conscious Spiritual Perception (Third Moment): The self-maintaining Comedy of Common Sense (cf. 131)

Self-Conscious Freedom:

- (a) The Epic love of Fate
- (b) The Tragic making of Fate
- (c) The Comic self-recognition of Fate

Rational Individuality:

- (a) The Cities as Spiritual Animals (Athena etc.)
- (b) The Natural and the Human Law (The Gods as *pathe*)
- (c) The Civic Testing of Laws

True Spirit from God's Side:

- (a) The Epic World of Recognition
- (b) The Tragedy of Ethical Action (reconciled in ethical forgetting)
- (c) Aesthetic Status⁸⁰

Notes

1. In giving this honor to Sparta I am following Herodotus (as I assume Hegel would). See especially *Histories* VII, 139, where Herodotus clearly says that it was the decision of the Athenians to resist that turned the scales for the Greek victory, but that the Spartans never had a decision to make about this; they always knew that they must fight as long as resistance was possible at all.

2. The definition of “*synthetic* laboring” here shows us why Hegel did not want to use the Kantian terminology for his own logical procedure. A Kantian “synthesis” is “the *mingling* of the heterogeneous forms of thought and the natural.”

3. S. Bungay (1984, 31–34) argues that Hegel’s *psychological* categorization of Art, Religion and Philosophy (in his mature system) as intuitive, representative and thoughtful respectively, is a logical error. But in the perspective of the *Phenomenology* we can see why it is necessary. (Of course, Bungay’s logical-systematic categorization—Art universal, Religion particular, and Philosophy individual—is also correct, and equally full of paradoxes.)

4. For a valuable comparison of chapter VII B with Hegel’s other discussions of the “Art-Religion” and the “political work of art,” see D. Janicaud (1975, Part 2, chapter IV). The critical contrastive use of “Reason” (in the “spiritual kingdom of animals” and “the Enlightenment”) is where Reason is an *attribute* that certain beings “have.” In the Hegelian reconciliatory sense, Reason is the self-recognizing capacity of philosophical consciousness, which unites the rational subject with “the whole” by grasping how every aspect of the whole is “necessary” (in different senses, which are the dialectical *levels* of objective rationality) to the “being” of the thinking subject, and every aspect of its own subjective activity is necessary to the thoughtful rationality of the whole. This sense of “Reason” is Christian-theological rather than Greek in origin (though we can recognize something like it in the pre-Socratics). But Hegel does not use the concept “theologically” (i.e. in reference to a whole

that is eternally self-completed and independent). He uses the theologically developed concept in the typical Greek way, to characterize what is uniquely (and distinctively) human. To call the Art-Religion “the religion of Reason” is an obvious paradox. But the historic monotheism within which the “theological concept” was developed is only “the religion of Reason” in a paradoxical sense likewise; it encourages us to *worship* “Reason” contemplatively instead of actualizing it. The true “religion of Reason” is the actualizing of the theological concept in a human life of thoughtful activity that develops from the foundation achieved in the Art-Religion. That (not any orthodox tradition of Christianity) is what Hegel calls “the Manifest Religion.”

5. *Politics* I, 2 (1252b).

6. *Politics* I, 2 (1253a).

7. There is no reference to the triumph of the Understanding in the Hindu settlement created by the “laws of Manu” here. That settlement has no place in the historical sequence of the argument. The “semblance of the organization of a completed whole” must be looked for in the Herodotean account of the caste-system in Egypt (echoed in various places by Plato). The *Egyptian* “order of spiritual nature” is the one that Hegel’s argument needs (both logically and empirically).

8. It is only when he reaches “the spiritual work of art” (at par. 727) that Hegel makes it clear that the free *Volk* has to be a free community within a nation of such communities. He uses the word *Volk* ambiguously, to refer both to the “free community” and to the *national* community of these communities.

9. Hegel’s use of *Unwandelbarkeit* (emphasized) gives us a clear indication that, before it takes “shape,” the Unchangeable Consciousness is for its Changeable side a *lawgiving*. But in True Spirit the “relation to the Unchangeable” is “boundless rejoicing and the freest enjoyment of self.” Whereas Reason and Spirit appear first “negatively,” the first station on the line of Unhappy Consciousness is positive. That line begins “happily” in the “earthly paradise” of the Art-Religion. But of course, the “infinite grief” will not be sublated altogether even there. That is why “Tragedy” is the high point of Greek religious experience.

10. Hegel speaks of “the distribution into the masses of the estates and their particular activities.” This clearly indicates his willingness to speak of the “social estates” as “masses.” So it may be that I have gone too far in trying to avoid this interpretation in Hegel’s discussion of the Ancien Régime above.

11. For the views of Thrasymachus see Plato, *Republic* I; those of Critias were expressed in plays ascribed to (and perhaps actually written by) Euripides—see D.-K., 88 B 25 (the “Satyr-play” *Sisyphus*).

12. *Jedes Volk hätte ihm*, Nohl, 216; Knox, 147–148.

13. Euripides, *Hippolytus*, line 612 (produced in 428 B.C.); Aristophanes, *Clouds*, lines 366ff (produced in 425 B.C.).

14. In applying this concept to the case of Egypt, there is no need to assume that any actual Pharaoh was as much an actual “craftsman of society” as Napoleon (say)—though the scholars do sometimes write as if the important Pharaohs were Napoleonic. The actual craftsmen were surely the priests (or some subset of them). Pharaoh was, for the most part, a *symbol*. This is demonstrated by the speedy failure of Ikhnaton (who certainly personified the attitude of the free craftsman, but wanted to break free from the sublated heritage of tradition).

15. I did not dare to write “she” for the Greek sculptor (in commenting on par. 698); but it is certainly legitimate to write “she” in other artistic spheres. For in the early career of the

Ethical Substance, at least, women were not penned up as breeding stock; and Sappho is unique only with respect to her survival. We have the names of some other major poetesses. Plato dramatized the ideal of True Spirit accurately in his proposal for a universal education; and it is logically appropriate that the great voices of Greek *tragedy* are perhaps more of them feminine than masculine. Antigone has many sisters.

16. When we formulate these two “tragedies” under the image of the “death of Art,” we must say that Art “dies” twice. First it dies “naturally” (as the religion of the community) when it has completely comprehended the tragedy of “the good life”; then it dies “spiritually” (like God) when it has completely comprehended *its own* tragedy—the necessary impossibility of a perfect “portrayal” of the incarnation of God in man. But this second death, like the “death of God,” carries a final (or properly absolute) resurrection with it. It does not matter how categorically Hegel may have spoken about this second “death” in his Berlin lectures (for which our evidence is at present very inadequate). Like the “death of God” the “death of Art” logically involves resurrection. Art can only “die” in the same sense (or senses) in which Religion and Philosophy can “die.” To worship a work of art now, would be idolatry; but we could say this now, even in the mistaken conviction that there is no higher form of divinity than Beauty. To *think* that a work of art expresses truth as absolute knowing is idolatry of a different sort (Plato’s Cave consciousness). But then, to worship the *Science of Logic* is idolatry also (and there are some who practise it); while to deny the very *possibility* of a “science of logic” is to worship our own rational intuition—an “atheism” that coincides with the most barbaric form of religion. Many (mistaken) interpreters of *Nietzsche’s* “death of God” seem to stand in danger of *this* judgment and hell-fire—which Dostoevsky characterized correctly as a world in which “everything is permitted.”

17. D. P. Jamros (1994, 152–155) takes the sense of “abstraction” to be “abstracted from life.” This is valid for the statue, but needs careful modification for the Hymn. (There is obvious equivocation in his discussion.)

18. This concept of “God in his House” brings to light the implicit significance of “here is a house” as the first example of Sense-Certainty in space.

19. It looks rather as if Hegel’s conception of the Animal-Religion arises from the retrojection of a Greek interpretation into Egyptian religion and its hypothetical origins. As far as Hegel’s understanding of the cultural history of Egypt is concerned this was probably inevitable; and we may well be sceptical that there ever were communities that recognized their own religious identity in this or that animal. This need not affect the validity of the underlying cultural analysis, if I am right in thinking that “symbolic” expression is quite arbitrary.

20. Compare the interpretation of Homer in the *System of Ethical Life* (Lasson, 499; Harris and Knox, 177); and for the views of Prodicus, D.-K., 84 B 5.

21. Plutarch, *Pericles* (Everyman, I, 255). According to Plutarch Pheidias died in prison, possibly by poison. The prosecution was part of a political campaign against Pericles by the aristocratic opposition. But what is interesting is the fact that conservative religious opinion regarded the self-representation of the artist as impious. (Hegel certainly knew this source and the story.)

22. This separation of joy from effort, is one aspect of the “abstraction” of this work of art.

23. André Bonnard (*Greek Civilization*, New York, Macmillan, 1959, II, 52) ascribes this to Pausanias. But I cannot find it in the *Description of Greece*. (T. Pinkard claims that the word “inspire” in 709 is misleading, but this shows that he is mistaken.)

24. G. Shapiro (1976, 25, col. 2) falls into the error of identifying the *abstract* with the *symbolic*. It is true that nothing can be “symbolic” without being “abstract” in the relevant sense. But it is precisely the linguistic Hymn that is the key to what “abstract” means as *distinct* from “symbolic.”

25. See *Laws*, II, 656d, 660a-c; and VII, 799a.

26. In paragraph 712 Hegel mentions “birds or trees or the yeasty earth.” The latter two refer to Dodona and Delphi. Augury by bird flight (and by the entrails of sacrificial chickens) was more typically Roman.

27. In paragraph 697 Hegel characterized the *Egyptian* oracle as “breaking out in the speech of a deep wisdom that is hard to understand.” Apparently he thought of oracular speech as a “unity of opposites” which went in a circle from (Zarathustra’s) revelation of common sense, through obscure speech, back to (Mosaic) common sense again. (Almost certainly he has “the Law and the Prophets” of Judaism in mind as paradigms.)

28. Sophocles, *Antigone*, 454, 456–457. Hegel now writes *Gesetz*, where he wrote *Recht* before (par. 437). Antigone said *nomima* (plural). It is probable that Hegel is paraphrasing his own translation from memory at this point. His emphasis shows that he intends this to be a quotation. But neither the words nor the word-order are as precise as they were the first time.

29. The way that Hegel deliberately *avoids* naming Socrates here, shows that his sparing use of names is a calculated policy. He wants the created figure of Antigone as his emblem here. I have referred to Socrates’ conversation with “the Laws” (in the *Crito*) because it seems to be the clearest expression of the “unwritten Law” of the public or daylight world. The critical editors think that Hegel’s description of what Socrates learned from the voice of the *daimonion* is based on *Theaetetus* 151a. (Their reference to 186a is a mistake or misprint.) *Theaetetus* 151a is where Socrates speaks of the *daimonion* telling him whether to associate with this or that person. But see also *Apology* 31c-d and 40a-c; and there is an important passage in *Phaedrus* 242c where he speaks of being his own “seer” for the interpretation of the “sign.” (The *Phaedrus* is perhaps the most important dialogue concerning “what is good and beautiful”.) The operation of the sign for or against a *friend’s* going on a journey is quite inconsistent with everything said about his “sign” by the *Platonic* “Socrates.” (This seems to be based on *Xenophon’s* account of the “sign.” I have not found the exact instance, but see *Memorabilia* I, i, 4. In *Memorabilia* IV, iii, 11–12, Socrates distinguishes between “reasoning” and “divination” as gifts of the Gods to humanity in much the same spirit that Hegel does here.)

30. *Republic* IV, 427bc.

31. The Cult should be seen as the “comprehensive inversion” of the Hymn, and the Hymn as the “simple inversion” of the Statue in its Temple.

32. The Beautiful Soul is another “consciousness that does not distinguish its object from itself.” But the “object” with which it is united is God, not the living body.

33. The original image was that of Jesus going “to prepare a place for us” (John, 14, 2–3).

34. It is perfectly appropriate therefore that She is the Earth-Mother, and the resurrected Spirit is the Daughter in the Underworld. The sex-bias that is evident in the Christian “Mysteries” would have to be completely sublated in a Manifest Religion that properly comprehends all of its “stations.”

35. The myth of how Prometheus *deceived* Zeus into choosing the outwardly *larger* share is in Hesiod, *Theogony*, 535–560.

36. Dionysus keeps company with Demeter and Kore. Herodotus identifies him with Osiris (II, 42, 49, 123, 144); this is consistent with his part in the Mysteries. But the “abstract underworldly essence” who receives the first libation is Hades himself (or Death). We should note that the piety of the “plant-religion” survives. But it is now a universal reverence for what must be *sacrificed* in its natural living shape.

37. Here again we encounter the enlightened rationalism that is common to Hegel and Prodicus the Sophist.

38. The obvious sources to consult, for “lingering” purposes here, are Plutarch’s *Pericles* and the great Funeral Oration in Thucydides II, 34–47. (The “dramatic date” of the *Republic* is quite indefinite, but it is certainly during the War, and after the death of Pericles.)

39. See especially paragraph 176 for the three moments distinguished here.

40. This is the *second* reason why the *Lichtwesen* should not be taken to refer directly to Mosaic Judaism (as W. Jaeschke argues—1990, 198–204). First the God of Moses is not a Nature God; and secondly “Israel” is a “self.” But Judaism belongs *logically* with the Hellenes. The Jews have made the transition of *abstraction*. Yahweh cannot get into the Phenomenology properly, because he is “invisible.” But Hegel indicates clearly where he belongs. (F. Guibal [1975, 108] remarks that both Judaism and the Reformation are astonishingly absent from Hegel’s phenomenology of religion. The view defended here is that both are present in the way appropriate to their essential inwardness, or *non-appearance*. Luther is the *Gestalt* of the transition from Unhappy Consciousness to Faith.)

41. As I see it, Hegel is conscientiously *obliged* to give an accurate rendering of how the Jewish heritage has been interpreted in the Christian tradition. Otherwise, he has not fulfilled his recollective task properly. But the “determining” moment of that *heritage*, cannot itself determine how Judaism (and the Jews) are to be received into the newly dawning community of “absolute religion.” Lessing’s *Nathan* is a more appropriate *Vorstellung* for that. (For Jewish-Hegelian theological critiques of Hegel’s philosophy of history see S. Avineri [1984—on Nachman Krochmal]; F. Rosenzweig [1971]; and E. Fackenheim [1973]. It should be clear that from the standpoint of the present commentary all such reactions arise partly from a misinterpretation of Hegel’s own theological language.)

42. This confirms our interpretation of the Abstract Work as “Satisfied Desire.”

43. See the *Frogs*, lines 324–413. Much is parody, but the underlying truth seems clear.

44. F. Guibal (1975, 77n.) points out that Hegel anticipated Nietzsche in opposing the Apollonian and Dionysiac sides of Greek religion. And there is, perhaps, an object lesson in the *Bacchae* for the society that makes war on “drugs” indiscriminately. Certainly our culture now has many devotees of the “mystery” of “life.” All of my own sympathies are with Pentheus; but we might be wiser to evaluate this devotion as a form of *religious* experience. It seems that Pentheus, who refuses to surrender to the “inspiration” of Life, is the figure of Phrenology—the self-confident finite Reason that discovers itself in the skull.

45. Even the philosophical amusement with which many of us regard the sporting “Halls of Fame,” was first ironically expressed by Socrates when he proposed to the jury at his trial, that he should be treated like an Olympic victor.

46. We can fairly infer that the Hymn of which Hegel is speaking is not *long*, and is learned by joining in with those who know it already; it grows and wavers in form, like the popular ballads that the educated world of Hegel’s generation had only recently begun to recover from their own past.

47. The athlete is a “beautiful fighter” but not (as both Baillie and Miller put it) a “beautiful warrior.” The athletic contest is the “reconciled shape” of warfare.

48. *Histories*, II, 53. (Herodotus was convinced that the Olympian religion originated in Egypt—see especially II, 50. This probably influenced Hegel’s religious anthropology.)

49. The reader of the *Phenomenology* will know by this time that both Understanding and Reason occur in several “shapes.” The engineering skill of the Egyptians is the *naïve* form of Understanding, which becomes *reflective* in Platonic mathematics, and *critical* in Kant. The “Reason” of chapter V is “estranged” from True Spirit (and is first “instinctive” empirical reasoning, and then Kantian critical “Reason” as opposed to Kantian “Understanding”). Before this we find the intuitively self-conscious Reason that is communally embodied (in True Spirit) and aesthetically expressed; after it we shall arrive at speculative Reason, which is communally embodied, philosophically self-conscious, and discursively expressed in a dialectically logical form.

50. See especially the “Tübingen fragment” (1793, Nohl, 10; *Sunlight*, 488); and the *Verfassungsschrift* (1801, Lasson, 135–136; Knox-Pelczynski, 241). The documentary evidence is somewhat slender; but when it is read in the context of the other manuscripts of this decade, and with an informed consciousness of Hegel’s sources (Plutarch, Thucydides), I do not think that my interpretation will be seriously disputed.

51. In all modern governments, the principle of “representation” is a mediating principle; and it is a necessary truth of politics that how “representation” can best be achieved must remain a contentious issue.

52. This is only a statement of “ontological logic.” “Achilles” is the “individuality” of the Myrmidons as far as participation in political and strategic decisions is concerned. But it is Patroclus, the *single* individual, who dies in Achilles’ armour, and Achilles the single individual who is shot by Paris. (When Hector is killed, the Myrmidons and Hector’s Trojans are presumably involved in the battle, but it is a singular corpse that Achilles first dishonors, and then surrenders to Priam).

53. At the level of the “hymn in praise of the singular God” each of the Gods can be identical with her *Volk*. But if we rationalize the action of the Epic in that sense, then all of the Olympians will lose their “particular” aspect. Aphrodite will represent a regiment of warriors just as much as her paramour Ares does. (*Ares* should not be identified with any *one* band of warriors in any case.)

54. *Republic* III, 388e–389a.

55. “Ethical” motives are by no means the same as “moral” or “immoral” ones. They are “passions” recognized as capable of determining the direction of human lives. Thus Hippolytus cares for nothing but hunting, and Phaedra becomes sexually obsessed about him. Both of them understand the ethical context which determines how they ought to deal with the *pathos* that they “suffer.” And both are transgressors because the bastard status of Hippolytus makes his reaction both to Phaedra, and to Aphrodite generally, unduly violent. It is this violence that provokes Phaedra’s transgression. The way that Hippolytus keeps her secret when she is dead, shows that his notorious claim that his oath was not binding upon him was only intended to prevent any renewal of adulterous proposals. But his threat was superfluous, because Phaedra was already resolved on suicide; and the lie with which she countered that threat was tragically superfluous likewise. The *Hippolytus* is a drama in which the interaction of ethical ideals with the “selbstische Natur” is made marvellously explicit.

56. None of the translations with which I am familiar has caught the reference to Homer's beginning *in medias res*; and all of them mistranslate the sentence in some measure. Baillie wrote "some hero," as if he did not even recognize who was meant; and he attached *losgebunden für sich* to *Mitte*. Miller follows him with respect to *für sich*. De Negri translates everything with exact literalness except *spielt*. This he renders *atteggia* (which means "poses [like an artist's model]"). Hyppolite leaves out *für sich* altogether, and reads in "middle [term]". Hegel intends a reference to the "free play of forces"; and *losgebunden* compares the motion of Homer's epic world to that of the planets round the Sun. Achilles is the Sun of this world of freely moving "individuals." This conception of the *Iliad* shows up the illusory aspect of the tradition that Homer begins *in medias res*, by underlining the fact that the "middle" of the *motion* is the true *beginning* of the action. The world of the *Vorstellung* has the "Wrath," not the War, as its "content."

57. In Tragedy the extremes "draw nearer" but they do not become properly identical. Hegel's insistence that it is the extremes of "singularity" that must "draw near to the content" incites us to go beyond the tragic hero, and beyond the world of *Vorstellung* altogether. The tragic hero is an "individuality." That is to say that she is a "concrete universal," or a unity of the universal with the singular. But this "individuality" is achieved synthetically through the singular *Vorstellung*, which "sets forth" a universal meaning. It is the same "part" that is played, whatever (properly *singular*) actor plays it. Thus, for instance, we *watch* Oedipus come to his death at Colonus. The poet has lived more than eighty years with this story—which he must have learned as a small child, because the popular imagination had arbitrarily fixed the death of Oedipus in his own native village, the place of Colonus the Horseman. Sophocles clearly wants us to see his drama as the consciously self-made "destiny" of a man whose "fate" fell upon him earlier as a direct result of his own actions, but like a blind Necessity, an incomprehensible "happening." But when all is said and done this hero of Sophocles' making is still not yet a "*within itself fixed and actual singularity*." The singularity belongs rather to an actor who portrays the universally significant "shape of consciousness." The extremes of singularity *proper* (Fate and the bard) will "draw near to the content" properly only when every ordinary, singular consciousness becomes a child of God with a destiny to forge for herself that is of "infinite" significance. (In that world the "heroes of myth become the "world-historical individuals.") Achilles must finally become Alexander (an identity which would, one feels, have delighted them both) or, more tragically, Julius Caesar (an identity which would, perhaps, have pleased neither). But that story we have already dealt with. The "biography of God" is concerned with the "salvation" of "everything human."

58. This is unusual, and requires a sophisticated dialectical interpretation to relate it logically to Hegel's view. But I do not agree with the view of O. Pöggeler (1973, 91) and C. Jamme (1983, 223) that the *Antigone* "replaces" the *Eumenides* as Hegel's paradigm of tragic collision. The two climactic tragedies are complementary; and an interpretation of the *Eumenides*' Chorus is possible that produces some insights. The Furies are pursuing Orestes and he has come to Athens to escape from them. Thus they are important *agents* in the drama. Far from being "powerless" they require divine agents to stand against them—but as against Athena they are "powerless" (compare the remarks of the Twins in Euripides' *Electra*, lines 1253–1257). Since they are essentially a community of spirits, they can only come on stage at all as the Chorus. From the Hegelian point of view this expresses two things: first, the fact that they are not agents in the ordinary sense; and secondly, the fact that they represent the community, which has been outraged at its most primitive level of being. No Greek audience could identify directly with the Furies; but they would feel very strongly

the sense of horror and outrage that the Furies represent. This horror can quite properly be called the “general soil” of the action.

59. What Hegel says about the occasional choruses of praise for particular Gods provides us with another source for his conception of the Hymn.

60. I am bound to say, however, that in the reexaminations of Greek tragedy that the exposition and testing of Hegel’s views has led to, I seem always to find that the dramatists preserve the harmony and self-consistency of the Olympians far better than Homer did. The Chorus does often *say* that the Gods are beyond its comprehension; but they are quite right to stand by their loyalty to the Gods as conceived by the poets.

61. See *Oedipus Tyrannus*, lines 1329–1333; and *Antigone* lines 916–928.

62. As far as I can see the aim of Euripides is to show us the human reality (and the human responsibility) behind the divine mask. Compare note 55 above on the *Hippolytus*. Through the use of the God from the Machine, Euripides made this main lesson fairly plain. His view of the Gods is very Hegelian, but his drama is often not “tragic” in Hegel’s sense.

63. *Poetics* 1452a–1453b. Bonsiepen and Heede note that Hegel uses Lessing’s rendering *Furcht* for *phobos*. I am not sure that this is significant, but I have no doubt that Hegel read Lessing’s discussion (*Hamburgische Dramaturgie* (*Werke*, ed. K. Balser, 5 vols., Berlin, Aufbau Verlag, 1978, IV, 358–367).

64. See the Choral Ode in *Oedipus Tyrannus*, lines 863–910.

65. If we let the Chorus be simply an agent, and regard the theatre audience as the real Chorus, then we can see the *Eumenides* as the enactment of the fundamental *collision* of the Laws at the *divine* level. (But the “doubled” perspective is even better.)

66. The *Hippolytus*, for example, seems to be about a conflict of the hero’s *natural* passions (hunting and sex). But the family-political problem is essential to it. A more general conflict of political and universal “ethical relations” is visible in the *Philoctetes* of Sophocles. I should very much like to have seen Hegel’s analysis of that (because he maintains that recognition of the living “person” is beyond the range of the ethical substance). The conflict should be conceived perhaps as one between the justice owed to another child of Zeus, and loyalty to the common cause. (It is not to be framed in Kantian terms as a matter of simple truth-telling.)

67. All of the crucial data about the mythic history of the Oracle (except for the actual *slaying* of Python) are given in the Pythia’s opening prologue to the *Eumenides* of Aeschylus.

68. We have Orestes dramas from all three of the major dramatists. But in the *Electra* of Sophocles, Orestes seems untouched by the horror of matricide, because Electra sent him away while he was still a child, and he has been educated to think of nothing but his duty to avenge his father. In the *Electra* of Euripides, on the other hand, the standpoint is “moral” rather than ethical. The solution of Aeschylus is accepted, but neither Electra nor Orestes is seen as worthy of salvation; so far as anyone is “justified” at all, it is Clytaemnestra, who represents herself as a martyr for female equality. Hegel’s view seems, as usual, to owe most to Sophocles.

69. *Eumenides*, lines 36–93. This is not a case where we can legitimately suspect Hegel of forgetting anything, since he refers to the final outcome of the play himself in the next paragraph. His oversimplification (or exaggeration) is deliberate. He means us to “linger” with the moment, by studying the play again. Bonsiepen and Heede are so cautious that they do not commit themselves about the identity of *der kindlich Vertrauende*. This characterization of Orestes seems to be based on his astonishing first speech in Sophocles’ *Electra*—see especially lines 32–36 and 59–72.

70. This is Hegel's best piece of *Hamlet* interpretation. It goes far deeper than any of the comments in the Berlin lectures on *Aesthetics* (at least with respect to what has so far been published).

71. Euripides accepts the traditional solution (at least in the main). But his Castor will not allow Orestes to return to Argos as King. Both he and Electra must go into exile permanently. Orestes becomes king of a settlement in Arcadia.

72. *Eumenides*, lines 613–617. Hegel is philosophically sentimental about Apollo. In the *Philosophy of History* lectures he remarked that “Apollo has no wife, but only a sister, and is not involved in as many ugly stories as the other Gods” (Lasson, 1923 [1976], 585). Karl Hegel printed “. . . in many ugly stories like Zeus” (*T.W.-A.* XII, 300–301; Sibree, 245–246). Apollo does not deserve this whitewash—see Graves, *Greek Myths*, chapter 21. But on the one hand, Hegel wants to idealize the God into the individuated shape of the Light-Essence; and on the other, to make his twin-relation with Artemis into an anticipation of the philosophical kingdom of Heaven. (I see no sign in Hegel's own sexual relations that his idealization of the brother-sister relation has a psychological origin. Of course, the modern disciples of Lavater will continue to “know better”; and as long as we can all see whose knowledge it is that they share, there is no harm in that.)

73. Euripides has brought the Gods onto the stage to speak for themselves again, so the identity of the “inner essence” is fully explicit.

74. One reason for the references to *Macbeth* and *Hamlet* is probably to draw attention to the fact that the spirits driven out of Heaven must still be *philosophically* laid to rest, even in the Christian world.

75. Euripides, *Alcestis*, lines 302–378 and 177–182. Euripides gives no clear indication of how the part of Heracles in bringing Alcestis back by wrestling with death at the grave is to be interpreted. But until Heracles' captive is unveiled, Admetus regards her as the new wife whom he has promised not to take. I have tried to interpret what Euripides signifies by the requirement that the restored Alcestis must remain silent until the third day after the funeral. See lines 1019–1148; on this reading the moral drawn by the Chorus “Many are the shapes of the spirits,/ And many things unhopd for do the Gods fulfil” (1159–1160) is an ironic escape from the promise made at 463–465. (If these lines are genuine both in this place, and the others in which they occur, then Euripides used them regularly as his “(un)happily ever after” formula—compare especially the end of the *Bacchae*.)

76. This “Necessity” is the same power that Antigone and Creon met in paragraph 472. D. Janicaud (1975, 238) is wrong to say that the Greek spirit is “dominated” by this “absolute negative” and “fears” it. The tragic heroes have neither of these “modern” attitudes. They learn to “reverence” *Schicksal* (cf. especially the change of Oedipus' attitude in the *Colonus* play). But it is precisely because they meet it *fearlessly*, that it reveals itself as the negativity of *thought*. “True” *Sittlichkeit* perishes, and the self-assertive singular thinking will emerge.

77. O. Pöggeler (1964, 296) remarks on the contrast between the evaluation of Comedy here and in the *Natural Law* essay. We shall soon see (par. 749) that the two texts would not be hard to reconcile; but Pöggeler is quite right about the *development* in Hegel's systematic concept. What Hegel's logic shows is that Comedy is the most *self-conscious* form of artistic expression. In the context of the Art-Religion, we can say that the Old Comedy is the *philosophical* mode of Art. Even that ceases to be true as a proposition about the New Comedy of Menander; and in any case it does not make Comedy the “best or highest” form of Art. Among the *literary* forms it is clear that Hegel regards Tragedy as the “highest” (the *noblest* or most *beautiful* expression of human nature). The evocation of Jesus at the beginning, and

Socrates at the end of the discussion shows this. But it is *Sculpture* that is the “absolute” art—the one that creates the *Gods*. Painting and Sculpture first show us what Art (and Art alone) can do in our experience. C. A. Tsakiridou (1991, 17) is right in saying that “It is the individual art object that verifies our thinking of the Concept”—but she would not accuse Hegel of having two irreconcilable philosophies of art, if she understood how limited that positive doctrine is. G. Shapiro (1976, 31, col. 2)—like many others—is simply *wrong* in thinking that the *culminating* position of Comedy makes it “supreme” (cf. Shapiro, 1986, 171).

78. Hegel clearly means to conclude the Art-Religion with the communal identity of audience and comedian as vulgar humanity. So it is possible that he does not intend any transition to Socrates in the *Crito* and *Phaedo*. My defence is *positively* that he has already used the *daimonion* of Socrates as the final shape of the Oracle; and that he uses *Platonic* language to characterize the action and argument of the *Clouds*. So I think we are justified in taking Socrates as the “destiny” of the Art-Religion. *Negatively*, however, I will add that the example does no harm. The voluntary death of Socrates is only an “anticipation” of God’s Passion; but the “mission” of Socrates illustrates the interpretation of Old Comedy as *we* are supposed to observe it. His life is the proof that what we have read into the Old Comedy, is indeed there to be observed.

79. W. Desmond (1989 in 1992a, 335) says Hegel is “laughing at the wrong thing.” But I suspect this is the wisdom of hindsight. If so, it is also a mistake, because Hegel is only laughing at the Hellenistic culture that has not recognized its “unhappiness.” In Comedy “religion” dies, and we reach a purely “secular” rational awareness of the “whole.” Many students feel that *leaving* the religious realm in order to return is not necessary (or alternatively, with a reader like Kojève, that the *return* is not really necessary). Flay’s notes (1984, 392–393, nn. 9–10) provide a vivid illustration—with Hyppolite as the “middle” who gets Hegel right. We have to understand that the *Phenomenology* comprehends the actual history of *our* religious consciousness. (G. Shapiro [1986, 178] says that Hegel’s *Phenomenology* is “absolute Comedy.” This is true in the sense that it replaces Dante’s *Divine Comedy*. Plato’s dialogues are the “absolute Comedy” of the classical world. Compare *Pilgrimage*, Introduction, note 91.)

80. In the comedy of Terence it is a *slave* who says: “I am a man, I count nothing human alien.” This is the true climax of blessedness in “the Art-Religion.” For this reason, we should not borrow “*free* status” from the finite political sphere; the Spiritual Work of Art is the *reconciliation* of “Dependence and Independence” in Freedom. Gillian Rose (1994, 14) asks whether the happy consciousness of Comedy is “attained by effort or by grace.” The answer is “not by effort certainly. By *grace* initially perhaps; and certainly by *Divine* grace in the salvation of the Unhappy Consciousness.” But what is important to Hegel is the *loss* of “happy consciousness”; and that is through the movement of political life.

Chapter 12

The Divine Self-Concept

VII C: The Manifest Religion

It is a mistake to call this final phase of Religion “revealed” (as the English translators both do). It is not geoffenbart but offenbar—not “revealed” but “out in the open” or “manifest.” The Christian Spirit has come out into the open, so that it is now “manifest.” The history of its “revelation” has already been dealt with in the evolution of finite spirit; and as we shall see in the review of the earlier stages here, the offenbare Religion is beyond the stages that were “revealed.”¹

Of course, it is right to say that the “result” should not be separated from the process; but the process from which the Manifest Religion must not be separated is that of Natural Religion and the Art-Religion. If we think of Manifest Religion as the Christian religion, the temptation to separate it becomes very strong. For the Christian attitude toward the pagans was very different from that of Herodotus (let us say) toward the Egyptian priests. The Christians thought of their “revelation” as cutting them off from the heathen, and as marking a new beginning in God’s relations with mankind. Only in the Jews did they recognize true forerunners, because their concept of “revelation” came from the Jewish Scriptures.

Hegel’s concept of Offenbarung is quite different and has no Jewish roots. He regards all religious experience—and particularly the experience of the Gentiles—as the self-manifestation of God. What distinguishes Christianity is the fact that God is now “manifest” as He is in Himself, i.e. as “Spirit.” But to manifest Himself is his essence. Not only does He speak; He is His “speech,” His Word. This sounds like orthodox Christian doctrine; but Hegel’s interpretation is not orthodox. For Christian orthodoxy says that God creates by speaking. Hegel reads this as meaning that God’s speech is the creation; and further that His speech is His self-creation. “God is Spirit” means that He is what He makes Himself into. Only what creates itself is “Spirit.” Hegel has already taken the first sentence of Genesis as the beginning of God’s biography: “Let God be manifest as Light.” Seen in this light the first sentence of John: “In the beginning was the Word, and the Word was with God; and the Word was God” takes the Christian revelation completely out of its Jewish background, and puts it into a Gentile tradition that begins with Zarathustra. The Unhappy Consciousness and Faith are only the phases of “estrangement” which the universal Gospel had to go through before it could repossess its own true cultural heritage—the experience of the despised heathen.

(a) *The Hellenistic Weltgeist*

- 1./748. Spirit has become subject now. It has gone over to this extreme through the motion of the Art-Religion from divine statue to human comedian. The substance has become its “predicate.” It is self-conscious, but it has lost its world of consciousness: “The Self is absolute Essence.”

The Religion of Art is the story of God’s manifestation as “natural man.” In other words, it is the world-historical manifestation of what the myth in the second chapter of Genesis means. Athena, Antigone and Lysistrata (in that order) replace Eve, and it is Orestes and Oedipus, Demos and Socrates who eat the apple. But the concepts of sin and disobedience, though not entirely absent, are successfully sublated. The *effective* “sinners” in the biography of the World-Spirit are the Romans. Obviously the Romans carry the experience of Greek culture forward with them; and as we move forward towards the conversion of Constantine—which is the moment where God first becomes “manifest” as *Spirit*—we must do likewise. Hegel himself makes sure that we do not forget the Persian and Egyptian heritage of Greece. All of it is essential to the “Absolute Religion” that passes over into Absolute Knowledge.

We can say that what is signified by the Natural Religions is the general proposition: “Substance is the absolute Essence.” But in these religions there is no “absolute Subject” who asserts this “proposition.” Even in the religion of the *Werkmeister*, it cannot be asserted.² Here, we have a human community that willingly accepts and affirms its own merely instrumental and obedient status. It dissolves itself back into the abiding substance of Nature as a whole: “the action or the self-consciousness [of the worshipping community] only disappears.” The worshippers think of their God as the supreme “Self”; but since they are not “actual selves,” their “absolute essence” is not an actual self either (par. 684). If God could *really* speak (in their terms) there would have to be some relation between his “I” and theirs; and his substantial being would no longer be “the whole”: Self-Consciousness remains implicit on both sides, and does not *do* anything. There is no solid relation of “trust” in which God and his community grasp one another. There is an immediate sense of “identity” (in which the finite selves are swallowed up). But there is no self-conscious *assertion*, that needs (or merits) a “proposition.”

Antigone seeks to give this absolute Substance a voice. But it is only her voice, and it fades away into her death. The incarnation of the “divine essence” through which the Absolute Spirit advances from this substantial status towards full subjectivity, begins with the statue. The sculptor is a worshipper who *brings forth* the divine shape, and *posits* the action, or the *self-consciousness* of the human maker (the emphases are all Hegel’s) in the sculpted shape. The great cycle of nature revered in the older piety was an awful Substance, in which self-consciousness was lost. That moment too is acknowledged in the Art-Religion; but trust (*Vertrauen*) now includes self-recognition, which was not present before.

The statue gives only an externally human shape to God. God’s immortality is expressed by the inorganic and alien stone. But the aesthetic community incarnates

its *living* God in the Hymn; and from that point onwards the incarnation of God in language proceeds steadily to the point where we recognize the actor behind the mask as the reality of the absolute essence. In tragedy it was the mask that represented the Substance, and the actor was still accidental. But in Comedy this accidental subject assumes its proper place in the sentence. The “essence” becomes a “predicate” of this subject.

Thus, in the Art-Religion “Self-Consciousness” has become “the absolute essence.” This is the final (and comprehensive) appearance of the immediate (or “natural”) Self-Consciousness in the phenomenology of Religion. In the Roman Cult of the Emperor as the Lord of the World, we have the moment when the serpent’s prophecy comes true: “Ye shall be even as Gods.” At that stage there is absolutely *no* essence in the objective world of Consciousness; the Spirit has lost its world of “consciousness.” The natural world is a realm of political expedencies and utilities—just as it will become once more in the Enlightenment. The Gods have gone to Cloudcuckooland; and the absolute Spirit lies in the tomb.

- 2./749. “The Self is absolute Essence” is a secular not a religious proposition. It will contain its own inversion which reduces the self to a predicate. This inversion will not make Substance into Subject directly; but it begins a long process of development for the observed consciousness—the process of the estranged Self. In the first substantiality the Subject disappeared in Substance; in the second proposition, the Substance becomes a predicate only. But finally Substance and Subject will now unite perfectly.

Antigone tried to give the absolute Substance a voice. But her attempt to make it speak was contradicted by the whole evolution of the Art-Religion in the daylight world. This evolution brought out the significance of the equal recognition relation involved in Antigone’s speech. It is not a religious consciousness like hers that can speak the truth of Comedy. It may be a philosopher consciously pursuing death like Socrates; or it may be one like Protagoras, who is sceptical about the Gods, but quite at home in the actual political world (and with his eyes wide open about its “ethics”). The experience of the secular self-consciousness that has reduced the objective order of consciousness and nature from a “substance” (ethical and natural) to a “predicate” of its own subjectivity—so that there is nothing divine left except that naturally embodied subjectivity—will be to discover how its definition of truth *inverts* itself.

From “The Self is the Absolute Essence” we shall pass over to “The Absolute Essence is the Self.” This “conversion,” which is a valid immediate inference in formal logic, signifies the transition from the world of the Happy Consciousness of Comedy—which is *sceptical*, because it knows the Gods have flown, and laughs at the folly of the Stoic who still thinks that life is a serious tragedy with a happy ending—to the Unhappy Consciousness which knows that God, the absolutely Unchangeable Essence, is the only *true* Self. In the Unhappy Consciousness, “the Self is downward-determined to the predicate, and the Substance raised up into the subject.”

But first the secular world passes under the control of a comically finite self who

is recognized as "God." This is the shape of Comedy as Religion. It was never very "funny," but Gibbon thought it was *happy*.³ In Hegel's view, this period of peaceful world-security guaranteed by the Roman Law was merely "boring." It becomes interesting only when the dialectic of despair begins. Politically speaking, the Absolute Self of the Emperor has no peers; all other selves are bondsmen subject to his life and death power. In its religious aspect, this is the universal relation of the World-Spirit to Mephistopheles the Comedian, as the Judge who "says ever nay."

The establishment of the Roman Imperial religion of Emperor-worship is the "movement" of the proposition "the Self is the absolute essence" from the sphere of the non-religious actual spirit into religion. But this movement is soon revealed as the first moment of its *Umkehrung*, or of the conversion of the proposition into the form "the Absolute Essence is the self." This converted form is the proposition of the Unhappy Consciousness; and Emperor-worship is "the first relation" of the Unhappy Consciousness for the World-Spirit. Hence, we find in the Imperial Religion, the "infinite" expression of all the moments that are sublated in the Unhappy Consciousness in chapter IV. Also, the Imperial Religion is an infinite shape of Sense-Certainty because God is present for Sense-Certainty in the Emperor (but the certainty is radically uncertain because he may die or be dethroned at any time).

This first direct inversion of the Happy Consciousness into Unhappiness does not make Substance into Subject "*in itself or for us*." We do not return from the climax of Greek Religion in Comedy to the beginning of Natural Religion with the Light of Day recognized as the absolute Lord.⁴ Instead we now enter a new non-natural world, the world of pure thought. The Absolute Essence—which was a kind of "law of nature" in "the first Substantiality"—has appeared as a positive law imposed by an alien self called "the Emperor." The Substance is personified by this alien other, whom we know to be another natural self. We, who surrender to the alien authority, know perfectly well that "selfhood" is the essence of this pretended Substance, and that both the Lord of the World, and we who are in bondage to him, are equal selves. *Justice* is "the Absolute Essence"; but the "selfhood" which we now recognize to belong to it necessarily, has departed into the realm of pure thought. The experience of Self-Consciousness is gone through now as a relationship between Reason and Nature. The Ethical Substance becomes a *doubled* world; and Self-Consciousness has to go through its spiritual evolution in the world of Thought. It must bring about the conversion of the proposition for itself. "Through offering itself up it *brings forth* the Substance as Subject." So in this process of *Bildung* "the Subject remains its own self." We shall see, very soon, that in the experience of the Absolute Spirit, this is the self-making of Spirit "out of nothing."

The Art-Religion is *explicitly* the Religion of "True Spirit," i.e., the religion of the Spirit that makes itself within (or in harmonious identity with) Nature. So before we can observe the Manifest Religion of Reason we shall have to follow the evolution of Absolute Spirit through the stages of Self-Estrangement and Self-Certainty. In this evolution "the two natures"—i.e. the absolute Nature of the Natural Religion and the self-made human nature of the Art-Religion—will be equalized in the complete mutual penetration of a perfect union.

In the Manifest Religion the two propositions—that “the Substance is the absolute essence” (which logically *cannot* assert itself absolutely) and that “the Self is the absolute essence” (which the comic consciousness asserts *finitely*, but which becomes a blasphemous absurdity when asserted absolutely)—both reappear. But they take on a new sense, such that they can *both* be asserted absolutely. “In the first substantiality,” says Hegel (repeating the point made in the opening sentence of par. 748) “the Subject only disappears.” But in the Manifest Religion, its disappearance into the grave is only the prelude to a spiritual “resurrection.” Similarly “in the second proposition,” (as Hegel carelessly puts it, without regard for syntactic consistency)⁵ “the Substance is only predicate.” This equal and opposite inequality of value (for as a mere “predicate” of human activity, the substance of nature equally “disappears”) will be done away with when the Substance is finally manifest as the absolute community of “resurrected” subjects. In the Roman Empire the substance of Religion becomes a predicate of Imperial policy. This is the first phase of the “motion” of the “the second proposition” as it emerged in the Art-Religion. During the following “cultural” dominance of the Roman Church, the second phase of the motion takes place, and the proposition of “substantiality” returns. It is only now that it is properly *asserted*; and the result is an opposite contradiction. The whole motion of the “return” is only possible because in *both* of its moments the Subject “remains the subject of Substance,” and “the subject remains its own self.” This is just what was not the case in “the first substantiality” (i.e. in “Natural Religion”); at that earlier stage there was no proper “subject” at all.

The “compensation” of the two natures (Divine Subject and human subject) is experienced in the “third relationship” of the Unhappy Consciousness (or, speaking with the rather rough accuracy that is appropriate for the sphere of World History, in the Reformed Church). But we have to realize that the final stage—where “the uniting and compensation of both natures [Divine Substantial Subject and finite or human subject] is produced, in which both with equal value are just as much *essential* as they are only *moments* too”—actually comes to pass only after the Revolution. The “equalization of Substance and Subject” happens only in the Napoleonic order which is still being born, and in Hegel’s own book. It is the *Phenomenology* that enables us to comprehend for the first time how the Absolute can be *just as much* Subject as Substance.

- 3./750. The Greek *self* is the fulfilled universality of the *Volk*. But now the *Volk*-spirits are emptied and gathered into a Pantheon of abstract thought, and the singular self emerges as the legal person.

The Art-Religion dissolved its own religious essence in the comic recognition that the imagination of the natural self had created the Gods. The Ethical Substance could maintain itself, with Comedy as an ironic moment of happy self-possession, only until the armies of Alexander arrived. With the triumph of the Romans and their Law, the “truth” of Comedy was asserted absolutely as a comprehensive inversion of the immediate truth of the Ethical Order.

In Roman Law there are only singular (i.e. *comic*) selves, recognized as legal persons (with different legally defined statuses); and communities are artificial constructions out of these legal atoms. There is no possibility now of a properly ethical identification with any community, or with some structure or activity of the community such as we find in Greek Tragedy.⁶ “Public spirit” could (and indeed did) continue to be an important motive in life, but it was now confined within finite (i.e. *bourgeois*) limits. The Jewish *Volk* was smashed and scattered, but then left in peace to be exceptional; the proselytizing of the early Christians—who wanted the same “exception”—drew the attention of their neighbors more actively, so that they got persecuted whenever some natural or social crisis made religious conformity crucially important. Organized persecution itself was one indication that religion had become a matter for legal regulation.

In religious life, the living spirits of the ethical communities have all fled from the Earth; what remains with us are philosophical abstractions (like the “Clouds”) and fictional pictures of the Gods who have departed. These, too, the law can easily recognize and define. The Gods could and did migrate freely between cultural worlds that were previously independent. Isis is worshipped in Rome. The great temple of Artemis at Ephesus (already a coincidence of opposites between the Moon as Virgin Huntress, and the Moon as the All-Mother) becomes the temple of Diana of the Ephesians in the New Testament. Pilgrims now came from everywhere with a bag of bull’s balls to offer to her. But the transformation of Artemis is nothing in comparison with the many identities of Zeus and Apollo. In the century before Constantine we find cults of Zeus-Helios-Serapis. Apollo is Helios, Horus, Osiris and so on. There were no cults of the “Clouds,” but the Aion (Eternity) was worshipped, as well as the god called “nameless,” and the “All-seeing Aether” (which would have delighted Hölderlin).⁷ So Hegel’s conception of the Imperial “Pantheon” is an oversimplification; but the crucial fact, from his point of view, is the cult of the Emperor. It is this which, in principle, makes human thought the explicitly acknowledged arbiter of the God’s existence, and so reduces all divinities—no matter how vividly they continue to be imagined and experienced as *Vorstellungen*—into a “pantheon of abstract universality or of pure thought.”

The difference between the Pantheon of the Art-Religion and the Roman Pantheon of “pure thought” deserves comment. The real “content” of the Greek Gods was the ethical devotion of their communities; and that is gone. No one dies for the City’s Gods in battle now; and the independent way of life that they portrayed is lost. Apart from that “content” the “form” of their unity was always completely free, imaginative and plastic.

But in the Pantheon of the Empire, the Gods have something approximating to legally-recognized status. Cults are defined and regulated; and some of the new universalist or monotheist cults are visibly the work of the theoretical Understanding. Much of what happens in the field of intellectual organization began spontaneously before the arrival of the Roman Peace. But from Alexander’s time onward religious *regulation* was a necessary function of government; and one crucial reason for this was that the ruler himself became the object of a cult. This changed the

character of intellectual speculation by giving it a necessary aspect of ideological bias (for or against some social authority or other). The innocence, the aesthetic freedom of the religious imagination was compromised, and the situation of “powerless Beauty which hates the Understanding” arose (par. 32).⁸

- 4./751. But this self is empty. It is an abstraction created by general recognition. Its own way of being is Stoic self-possession in thought. This passes through Scepticism to the Unhappy Consciousness.

The Roman Emperor was, on the whole, an “empty Self” in religion. He let the content go free. Only those who refused to make formal acts of recognition (either of the Emperor’s own divinity, or of some other God(s) of whom their neighbors were seriously afraid)⁹ were persecuted: that is to say only the Jews and the Christians—especially the latter, because they were new, and they were eager missionaries. Anyone (even Caligula’s horse), and any group could be a legal person; and equally, anything could be a God (as long as the God had no imperial ambitions, and the worshippers were not stiff-necked towards other Gods).

Thought was “free” in the sense that it was self-contained; it let reality go where it would. This was the Stoic attitude—the Stoics insisted that we were all children of one Zeus, but conceded that he is “called by many a name.”¹⁰ Agnosticism (or, in philosophical parlance, Scepticism) is the proper name for this “freedom of religion.” According to Hegel’s logical analysis, this luxuriant mingling and multiplication of cults becomes the Unhappy Consciousness, because the Unknowable is literally unbearable. But it was mainly the fact that “anything was permitted” for those in pursuit of the Imperial Power that made it unbearable.

- 5./752. As self-consciousness the Unhappy Consciousness knows just how completely emptied out it is. This is the final fulfilment of the happy consciousness of Comedy. It is the tragic consciousness of the self-certainty that has lost all essence—the painful knowledge that “God is dead.”

The Unhappy Consciousness of the World-Spirit has the political chaos and religious anarchy of the pagan world as its conceptual context, not the sin-consciousness of Judaism. It arises from the experienced impossibility of knowing the “unknown God” without faith, or of doing what is right without charity. Paul and Barnabas were shocked by the “barbarians” who mistook them for Hermes and Zeus.¹¹ They were building the Unhappy Consciousness when they denied the identification.

The Sceptical consciousness, which is content to be the absolute criterion of truth, and to receive all “divine essence” in the shape of that subjective confidence, is still happy. But it becomes tragically unhappy when it reflects upon its condition of absolute alienation from all positive truth (i.e. from all *substance*). In this reflection it loses not only all “essentiality,” but even the certainty of its negative essence. What sort of certainty is this sceptical certainty that we know *nothing* for certain? This is the puzzle that turns into the awareness that “God is dead.”¹² Hegel calls it

“the opposite side and the complete fulfilling” of the Comic Consciousness. He will now explain how this is the case.

- 6./753. The Unhappy Consciousness is the knowledge of what is *lost* in the happiness of the Comic Consciousness. Legal personality and Stoic independence are worthless, and all objective values are lost. The impulse that created great art is destroyed, and the art itself is fruit plucked from the Tree [of Knowledge], offered us by a maiden [Mary]. They are now the subject of scholarly reconstruction. But the girl who will be mother of Destiny is a higher mode of being than the fruit was when it was on the tree. For we can recover what is gone only by recollecting (inwardizing) it; and it was only an outward presence originally.

For the Unhappy Consciousness at its birth, the experience of alienated loneliness has become absolute. The happiness of this life does not satisfy the religious need; so legal recognition is worthless, but the Stoic freedom of thought is of no value either. Epictetus still expresses the Comic Consciousness, but the Emperor Marcus has gone far along the road to unhappiness. Trust in the ethical order (Antigone’s “eternal laws of the Gods”) has failed; the Oracles are silent. The divine statues are stone idols, the hymns are pretty poems; sacrificial feasts have lost their spiritual meaning. No one can create new poems or dramas, and the classical heritage is just that—a heritage of art.

This has to be taken as a characterization of how the late pagans themselves experienced their world. No one who was already a Christian could be in this “first relationship” or primitive condition of the Unhappy Consciousness. How can the silence of the Oracles be a “loss” to any Christian? It was in his Plutarch that Hegel found the pagan sense of this loss.¹³ But the “death of the gods” into mere “literature” was a contemporary experience for Hegel himself, as his own remarks show. We can find it movingly expressed in the first generation of Romantic poets everywhere—in Keats and Shelley for instance. For Hegel himself, the expression of it that was closest at hand was in Hölderlin’s *Hyperion*. We can never turn back to worship Zeus, Apollo and Athena; and our study of Greek religion and life is pure scholarship.

The most interesting problem here is the interpretation of the girl who offers us the fruit from this Tree of Knowledge. Mythically, she is the Virgin-Mother of us all, the second Eve. The poets received their inspiration from living Memory (Mnemosyne). But now they and their divine mother of the Muses are reduced to the vegetable level; they are a fruit-tree. The poetic truth grew on the tree of Greek Civilization; and now it has been plucked, and it is presented to us by the spirit called *Erinnerung*. This is not the orthodox “Holy Spirit,” but the Spirit of Hegel’s *Phenomenology* itself. The little myth in this paragraph states the relation of Hegel’s “art of the Concept” to the “glory that was Greece.”

Hegel’s Science of Experience puts the Incarnation and Pentecost of the Spirit back into the Graeco-Roman context of our political and cultural history; but his “art of *Erinnerung*” gives to that classical heritage the deeper spiritual meaning that it assumes within the total concept of the human community as “the body of

Christ.” Our own pantheon—the one that we are assembling in Hegel’s seventh chapter—is a community of living Gods once more. We do not, and we cannot, worship Zeus and Apollo; but we still have a share in the lives of those who did. A later Romantic poet, the Italian Carducci, wrote “Jove dies, and the poet’s hymn remains.” This expresses perfectly the early romantic nostalgia. But Gentile—a philosopher with deeper Hegelian insight—commented rightly: “The truth is that if the hymn remains, then Jove does too, for he lives in the hymn.” That life is what historical *knowledge* actually *is*; and the greatest achievement of the *Phenomenology* is to have mediated the philosophical comprehension of this truth successfully.¹⁴

- 7./754. For self-conscious spirit both the Greek achievement in the Art-Religion, and the Roman law (including the struggle for the Imperial Purple) in the real world were necessary; also the philosophical achievements of Stoicism and Scepticism. All of them meet around the cradle of spirit as human self-consciousness.

The spirit of the tragic destiny that offers us the erratically plucked, and generally chance-preserved, works of Greek Art and literature is, in the first instance, the imperial spirit of Rome and Byzantium. But that spirit of alien authority is only the first stage of the long process of the “inwardizing” of what was originally “uttered” (i.e. embodied in an outward form) by the Greeks themselves. Hegel refers to the sculpture, the Mysteries and the Games; but it is essentially Greek poetry that is the “uttering” of Spirit. The “spirit that is self-consciously aware of itself as spirit” needed to have the whole circle of the aesthetic religious experience present in the world of its “consciousness.” It is clear that Greek philosophy is included under the “expansion of the *Vorstellung*” created by “pure speech” into a “world that finally gathers itself together into universality.”

The Manifest Religion is not simply a Gospel that came forth from Judaea; it is a gospel about the “inwardizing” of the Pantheon that the Romans established. The “coming forth” of the absolute Spirit that is self-consciously aware of itself as Spirit is identical with the “inwardizing” of the pagan world. Greek Art, comprehended as a “circle of producings,” is the “absolute thinghood” of Spirit. It is the literary remains that are most essential, because *language* is that form of being (or of objectivity) which cannot be sundered from the Self, or from self-consciousness in its logically inevitable singularity, without ceasing to be the thing that it is.

From being language the literary remains sink down into mere marks, if they are not read and understood. The understanding may of course be a misunderstanding; what is said may not be comprehended. The pagan world did not comprehend the Christian gospel for a long time; and that was only a mirror-image of the fact that the Christians, with their Galilean Gospel, could not comprehend the pagans. One could hardly make this last point more graphically than Hegel does when he enumerates the “shapes waiting anxiously in a circle round the birthplace of Spirit that is coming into being as self-consciousness.” This is a transparent reference to the manger at Bethlehem. But the shepherds in the Christian myth are replaced by Plato’s hymn-singing peasants (the “sense-consciousness” of spirit as language); and by the athletes (“beautiful *self-like corporeality*”), the actors of tragedy and

comedy, Roman citizens (“the *world* of the *person* and of Right”), the Roman legionaries and the barbarian invaders (“the devastating wildness of the elements of the content let loose”), and the Stoic and Sceptic professors. The three Kings, present only as *Vorstellungen*, are Achilles, Orestes, and Oedipus. But the Stoics provide a flesh and blood Emperor in Marcus; and in Marcus we do find a touch of the “penetrating grief and yearning” of the Unhappy Consciousness which is the “midpoint” of the circle assembled round the Manger. We can also say that the communal “birth-pangs” of this new Nativity are best represented by two more emperors: Constantine and Julian. So we can put three real kings beside the three tragic masks if we want to.

(b) *The Incarnation*

- 8./755. Spirit presupposes both that substance empties itself out to become self-consciousness, and that self-consciousness is emptied out into thinghood or universal self. The first movement is from unconscious necessity to consciousness. Then consciousness must move to absolute consciousness (spirit). It must recognize that unconscious necessity as the same self-consciousness that it is itself. As actual *living* self-consciousness it has a *mother* [the Memory-Maiden] but its Father is unknown.

The two propositions that were derived from the “result” of the Art-Religion earlier, are restated in paragraph 755. We should remember that in paragraph 749 Hegel derived the “two propositions” from the single proposition “the Self is the absolute Essence.” In Natural Religion there was no “proposition” because there was no “acting or Self-Consciousness” that could properly assert any absolute truth. We can only have two equal “propositions” when the fearful Substance *reasserts* itself, and when the secular proposition “the self is the absolute essence” has converted itself into the religious proposition (of the Unhappy Consciousness) “the absolute essence is the self.” Then we have two equal and opposite propositions in which the object and the subject of the active self-consciousness are each in turn reduced to a “predicate.” These two “propositions”—the proposition of the Human Comedy, and that of the Divine Comedy respectively—must now be transformed by historic mediation into a perfect equality of recognition, and so into “identity.” In other words, the World-Spirit which passed *immediately* from the Happy Consciousness to the Unhappy Consciousness must now make its way forward out of that contradiction, and achieve a form of Happy Consciousness in which the validity of the experience of “unhappiness” is still acknowledged; and the reconciliation must be achieved at the *religious* level—the level of the universal community of “thought”—not at the level of the finite community of “life” that was reconciled with the tragedy of existence in its art. The absolute shape of Destiny, Fate or Necessity (in which the artist’s Gods were engulfed) must be transformed into the “Providence” of a Self that is at home with itself (*beisichselbst, chez soi*) in its “opposite,” the necessary order of Nature.

The first proposition is now formulated as “The Substance alienates itself from itself and comes to be Self-Consciousness.” This has happened in the comic self-

consciousness of the Art-Religion. The experience of the classical civilizations now provides Hegel with his interpretation for the traditional theological dogma of God's self-emptying or *kenosis*. To use the terminology of paragraph 749, the "absolute essence" becomes *a* self; and to "become a self" is to become an *embodied* self-consciousness. *Recognition* of the singular embodied self is the middle through which "thinghood" as such becomes identical with "the universal self." The acceptance of "legal status" is the "emptying out" of the Comic Consciousness into "thinghood," and at the same time the establishment of singular human selfhood as the strictly *formal* universality of the Law.

In the new Gospel, that *secular* transformation receives its *religious* expression. The meaning of the Incarnation is that God and the finite self become identical as the categorical selfhood of the substantial world of human existence. In this way the secularization of the religious self-consciousness achieved in Comedy is transposed back into religious terms; and the singular self-consciousness takes on a *concretely* universal (or "infinite") significance. But in this renewal of spiritual concreteness, the structure of self-alienation (*Entäusserung*) is preserved. The Self is still emptied out into "thinghood" in this present world; the concreteness of spiritual union with God is all in the "other world."

At this stage God has not really alienated himself. He took human shape upon himself in a *Vorstellung*; but he returned to his own Kingdom, and the *Vorstellung* remains as the guarantee of what is true "in itself." In this world the divine Substance is present only as the harsh necessity of Nature, and as a legal authority that is ultimately only "the will of the stronger." But our conscious relation to Nature, is one of "freedom" (since we know we are "saved"); and the will of the stronger in this world itself is a human will. This is what it means to say that "substance is *an sich* self-consciousness" and "self-consciousness is in itself the absolute essence." God is Spirit for this self-alienated consciousness because the Divine Substance is its own true community. The "happiness" of Comic Consciousness is emptied out into the Beyond; the "unhappiness" of "necessity" is our experience here.

Thus the Unhappy Consciousness in its second relation succeeds to the directly paradoxical identity of Stoicism and Scepticism with the Emperor and the legions. As ethical substance, the Greek world became properly singular self-consciousness through the transition into a blind "necessity." That necessity took the shape of a universal tyrant, because "in itself" it was the necessity of universal self-consciousness. The relation of inequality between Substance and Subject is not changed by the shift from the Imperial authority (Substance as emptied into a subjectively incarnate Necessity) to Papal authority (Self-Consciousness as the thinghood of bondage to the body in this world, and to the universal Divine Self in the other world). But instead of a Law enforced by the "will of the stronger," we do now have a free self who recognizes the divine Will as what it is "in itself"; and it does this through the mediation of *another* self. This is what Hegel means when he says that "the alienation [*Entäusserung*] of self-consciousness expresses this: that it is the universal essence *in itself*. Or since the self is the pure being-for-itself that remains at home with itself in its counterpart [it expresses] this: that, for it, it is the

case that the Substance is self-consciousness, and is *ipso facto* Spirit.” God, the substance into which self-consciousness “utters” itself, speaks to it through the priest—who is truly a *Gegenteil* in which it “remains at home.”

So we do now have an “actual Mother” (the community of the Church Militant, here in this world delivering the absolution of our sins) and a “potential Father” (the Divine Will in the other world, for which the Church authority speaks).¹⁵ But the Spirit born of this curious reading of the Virgin Birth story takes a long time to grow up, and to recover the absoluteness of “Self-Consciousness” that resulted from the Art-Religion, so that the converted proposition “the absolute essence is the self” can finally be converted back again without either contradiction or loss. At the moment the whole world of the Art-Religion—the world of human action and self-expression—has become a mere “predicate” of the Church Militant. The selfhood of every human has an absolute value; but it will only achieve its proper status in the “resurrected” body of the Church Triumphant.

This “inequality” of the two sides (and of the two propositions) will be negatively “equalized” in the revolutionary process of Enlightenment and Terror and positively comprehended in the community that possesses the Science of Experience. “Absolute Knowing” is the true “resurrection of the body.”¹⁶

- 9./756. The alienated self-consciousness knows that its world is all spiritual in essence. But until it knows that the divine substance has alienated itself into a self-consciousness, it can only produce a subjective reinterpretation of all religious experience [as in the Gnostics]. This is just a subjective rapture in the sleep of Reason.

The *conversion* of the Comic proposition (“the Self is Absolute Essence”) happens first subjectively—as it must, because the absoluteness of the human self as the creator of all meaning is the point that we (and the World-Spirit) have just now reached. There must be a conversion that takes place in consciousness only; when the real world of its secular happiness is forcibly taken from it, the free imaginative power of Greek culture must, perforce, seek asylum in the world of thought where God can still be found. It knows (now) that God is Spirit (another self-consciousness like itself) and that all objective *Dasein* is God’s expression, just as the art and literature, which have lost their public, substantial significance, are its own free expression. But it can only *imagine* the selfhood of this absolute Spirit.

This is the world of Gnostic mythmaking, the world that is *ready* to receive the Gospel. It will accept the “good news” of God’s coming to earth and dying as a man, because that news confirms its own imaginings. Not everyone can be a Stoic, and think conceptually about the Absolute Mind of which we are all “divine sparks.” But even an illiterate serf can imagine God’s humbling himself to the human lot, and returning to his own place after rising from the dead. The Empire has created one world, in which all the stories, all the traditions, have been dislodged from their substantial moorings, and thrown into a disorderly whirling mass. Salvation stories are told everywhere, because salvation is now so badly needed. Everything in the actual world is just a sign or symbol of some esoteric

“spiritual” meaning. Only in this cultural melée of Gnostic fantasies could the Gospel take hold.

The Spirit that *appears* in the *Phenomenology* is the “true Gnosis”—the “absolute knowing” of the true meaning of human existence. All of our actual world, and of our cultural heritage, is a mass of *signs*, the empirical aspect of which is quite unimportant and “unreal.” Without its methodic commitment to the *historical* “actuality of the Rational” the *Phenomenology* itself would be just another Gnostic fantasy.¹⁷ There were, inevitably, many systems of Gnosis. However much it preyed upon them, and borrowed from them, Christianity differed from these fantasies, because it was fastened down by the historical origin and setting of its Gospel. But that was a matter of “faith.” It is only right for Hegel to emphasize that it was the Gnostic attitude toward the world that provided the “element” for the reception of the Christian message. He has to take the new religion as a work of the creative imagination, because God as Spirit must create himself “out of nothing”; so the Gospel story is historic, only because the faithful *believe* that it actually happened.

The religious imagination establishes the realm of “pure thought” in which all *spiritual* truth has its being. But this is only the “night” of the natural self-consciousness *projected* into a universally shared world. The Gnostic interpretation of the world and of its traditions is a rapture, an ecstasy without any observable foundation. It is not controlled by any reference to the *actual* world of finite life.¹⁸

- 10./757. The objective significance of the record must come forth from the Concept as necessary. That is how self-knowing spirit has come forth from immediate consciousness for us; it followed the same path by which Consciousness alienated itself and became the Ego. But what has come to be for us now is the self-cognition of Necessity: both a Necessity that is intuited as being, and one that comprehends itself. The success of the Gospel indicates the arrival of the World-Spirit at this moment of self-knowledge. We have seen how it got there.

This is an appallingly difficult paragraph to analyse in a summary way, because Hegel is seeking to correlate the phenomenology of Religion with that of finite spirit. We have reached the moment when the independent self-creation of Spirit begins; and Hegel has to explain the difference between our entry into “the native land of truth” as free self-generating Spirit (chapter IV, par. 167), and our entry into it as natural Reason when we arrived at the Art-Religion (pars. 699–700).

The Greek world and the Greek experience puts before us what Spirit is as an object of Consciousness (or as Spirit in immediate harmony with Nature). But the Greek Spirit did not know that it must create itself “out of Nothing” (i.e. out of purely spiritual materials, or out of “pure thought”). The *free* self-production of Spirit must begin in a cultural world in which thought has been set free, and in which it is freely busying itself with the completely arbitrary and capricious attaching of spiritual meanings to the cultural record. In this element, and against this background of accidental free choice, a *necessary* process of conceptual self-manifestation can and does unfold.

This necessity must first of all be *in itself*, i.e. the historical record must be there “for us” as an immediate fact of consciousness. We have seen the empirical self-consciousness of the comedian, and his audience, emerge as the immediate shape of “Necessity” for the whole world of consciousness constituted by the Ethical Substance. Hegel claims here that this emergence of the Concept took place “according to the same necessity as [that by which] *being*, or the *immediacy* that is the contentless object of sensible consciousness, empties itself out from itself and becomes Ego for consciousness.” But the dialectical movement of Religion is so much more complicated than that of finite consciousness, that the direct parallel is not easy to see.

We should begin by noting the direct parallel between Nature-Religion and Consciousness. But that was only the previous stage in which the “self-knowing Spirit” of the Art-Religion “arose for us through the cognition of the *immediate consciousness*, or of the consciousness of the object *in being*.” (It is clear that Hegel means to refer to our observation of Natural Religion, and not just to our observation of Consciousness in chapters I–III, because it is the Self-Knowing Spirit that arises through its necessary movement here, and not the finite self-consciousness.)

But then “*Secondly*, this Concept, which as immediate, also had the shape of immediacy for its consciousness, has given itself the shape of self-consciousness *an sich*, i.e. according to the very same necessity of the Concept.” So a direct parallel has to be sought in the Art-Religion also. The Abstract Work of Art is to be interpreted as the “sensible certainty” of identity with God; the Living Work of Art is the “Perception” of that identity; and the Spiritual Work of Art is to be seen as the “Understanding” of it. The singular self-consciousness of the artist as Comedian is the “result” of the whole movement.

The religious “Understanding” of Art is the self-understanding of the artist (shared with his audience). This absolute consciousness of Comedy must now go through the “experience” of finite self-consciousness in chapter IV in order for us to reach the true “Religion of Reason.” In the “phenomenology” of the Manifest Religion, therefore, we must expect to find a repetition of the moments of mortality, servitude, formal freedom, scepticism, despair and absolution. By this path of development, the physical necessity that simply exists must empty itself out (*sich entäussern*) into the cognitive necessity of rational thinking. The fate of being finitely human and mortal which the comedian proclaims when she peeps out from behind the mask and says: “It is all a joke! There are no Gods and heroes really, there is only someone here who is just like yourselves” must become the “intuited necessity” of a conceptual consciousness that is “at home with itself in necessity, and knows and comprehends it.” The “actual World-Spirit” of the Empire has become this “comprehended necessity” *an sich*, or logically. Now it must unfold as the actual process of the self-creation of the Absolute Spirit “out of nothing.”

Since the *being* of the Absolute Spirit is the same natural *necessity* that is the object of Understanding in the phenomenology of simple Consciousness, the “unity of being and thinking” requires that the self-production of Absolute Spirit must be a parallel evolution of physical and logical necessity. What necessarily happens historically, must come to know itself in the mode that *we* can see to be

logically “necessary”; and since the parallel is with the motion of the singular self-consciousness, the very first “necessity” that we can recognize in this connection, is that Spirit must visibly come to be as a mode of intuition which has left sense-consciousness *behind* it. Not only that, but the whole phenomenology of Consciousness, Self-Consciousness, Reason and True Spirit, must *all* be behind it. They are what is now buried in the unconscious treasury of spiritual life which the community that knows itself in the Religion of Absolute Spirit has to have.

The last moment to go into the darkness of that treasury was the Protagorean Self-Consciousness of the Comedy that knew itself (with infinite sadness, for it is the consciousness of what is lost that makes Aristophanes great) to be the absolute criterion of what is, and what is not. That memory therefore is the first moment to be converted by the Spirit; the new world-religion begins with the *memory* of a creative genius who was a “Man of Sorrows.” The Man of Sorrows is united with the Substance that has been “lost.” He is recovered in memory only. The sensible event of his appearing, is buried in the “night” of the past. The Hegelian Manifest Religion is not in any respect the religion of the primitive Church.

The crucial point is that to “remember” something is different from the conscious knowledge that you are imagining it. What is remembered now is that God was sensibly present with us and died among us. It is *remembered* (rather than dreamed) because the world has come to the point where the memory is necessary. We do not *know* what happened historically, but our faith tells us that we are remembering a “Gospel.” The necessity of this Gospel is what we have already comprehended; and it has nothing to do with empirical truth, because no empirical event could be “necessary” in this conceptual way. In a world full of saving fantasies, a story that is reported as history emerges; and the world must *believe* it, because its truth is what is logically needed.

- 11./758. How it happens is that the belief appears universally that the Spirit is incarnate for sense. This experience is not imaginary [as in Gnosticism] but is actually the case.¹⁹ We do not have to go out of consciousness to find God; we are immediately aware of God as this man of flesh and blood. This is the *positive* religious self that complements the negative self-consciousness of the actual world.

What is “remembered” is the work of the same imaginative power which in its *free* activity we are bound to recognize as “making things up”; or (as Hegel puts it in par. 756) the imagination is adding a quite gratuitous and unjustifiable interpretation to remembered material. Thus it is perfectly plain to the Understanding that the story of Mary’s pregnancy and of the manger at Bethlehem is an imaginative embroidery upon the biography of the man Jesus, whose birth was later *believed* to mark the advent of the Absolute Spirit in human form. The Virgin Birth story is a Gnostic fantasy if ever there was one; yet this was the first aspect of the “memory” that Hegel himself alluded to, and it is evident enough that no objective historian could call it “a borrowed significance, and a garment that does not cover the nakedness of the appearance and earns neither belief nor reverence.” The reverence for

the Virgin Mother, is second only to that felt towards the Child who appears by magic, as if coming from fairyland in a folk-tale.

Hegel says: "the fact that the absolute Spirit has given itself the shape of Self-Consciousness *in itself*, and hence also for its *consciousness*, appears now in this way that it is the *belief of the world* that the Spirit *is there* as a self-consciousness, i.e. as an actual man."²⁰ By the time that "the belief of the world" actually appears, the Nativity story is just as firmly (and as generally) believed to be an actual fact, as the other boundary of the *thereness*, the "Crucifixion under Pontius Pilate." Both articles found their way into the Creeds in due course (and not too long after the appearance of the Spirit as the "belief of the world").

We cannot cleanly separate the Pontius Pilate story which (as far as our historical evidence goes) is worthy of empirical credence, from the Nativity myth which never was, and cannot ever be worthy of such credence. The presence side by side of the myth that we *cannot* believe, and the story that we generally accept (though with all the controversies that must arise about evidential sources of the Gospel type), highlights for us the fact that the decision to believe either of them, was and still is a *free* one; and further that the free decision to believe something (to accept it as historical not imaginary) does not establish its objective validity. Just as we no longer believe the Bethlehem story, so we might come to regard the Pilate story as a fiction. *It is of the essence of memory that it may be imaginary.* This is a logical fact that is vital to Hegel's doctrine of Spirit as self-creative "out of nothing" (i.e. out of the creative imagination).

Consciousness, Self-Consciousness, Reason and True Spirit all lie behind Spirit at the moment when its "self-creation" begins; they are available to it, but it is *free* of them. Its self-creation begins with an *act of faith* that takes a "Divine Man" story of the Gnostic type to be *historical*. This is an absurd—an *irrational*—act, the act of a "faith" that knows itself to be "beyond Reason." Many of those who became Christians by conversion—Constantine, for example, since I take him to be the actual *Gestalt* of "the world's belief"—were philosophically educated persons, who knew quite well what they were doing in this respect. It was precisely these thoughtful educated men (and probably an at least equal number of educated women, too) who *made* the Christian faith.

The supposed founder certainly did not make it. Given that he was a historical person, he could not make it, because he was the object of it, and it was principally concerned with the significance of his *death*. Even Paul did not make the faith, though he made an important contribution to it. Constantine himself only facilitated its "appearance." The "appearance" itself (in the full panoply of the Condition of Right) was at the councils of Constantinople and Nicaea.

The "belief of the world" canonized certain written *accounts* (*logoi*) as historical. Men and women, whose names were still remembered, Joseph and Mary, Peter and John, and the rest, had *seen*, *touched*, and *heard* the Divine Man. But if this was the canonized faith, why does Hegel here state the "belief of the world" *in the present tense*? Why does he speak of the Divine Man's *being there* as a sensible certainty *for the world*, and of his presence not as remembered, but as "an actual fact"?

Even if we could credit—in spite of all the historically later “shapes” which Hegel has already claimed were ranged in a ring round the Manger—that he really does mean to assert that the “belief of the world” appeared when an unlettered Galilean fisherman supposedly said “Thou art the Christ, the son of the Most High,” how *can* he say that “the believing consciousness,” *in general*, “sees, touches and hears” this Godhead?

This is the “intuited necessity of the Concept that is at home with itself.” Hegel endows every Christian from Peter onwards (and specifically Constantine and the Councils) with the philosophical capacity to use the “eternal present.” The man Jesus is “the shaped Unchangeable.” This is what is logically entailed by the fact that the Absolute Spirit is believed to have given itself the shape of Self-Consciousness *an sich*. Moreover, Jesus said “Whoso believeth in me, shall never die”; so Peter still *does* “see, touch and hear him” at this moment; and I (Constantine or Athanasius) see, touch and hear him likewise in my faith—specifically when I receive the Sacrament, and hear his words read in the Gospel. Otherwise it would only be a Gnostic fantasy that God ever was incarnate in just *this* man. Hegel is describing the second relation of the Unhappy Consciousness in its saved aspect *philosophically*. This is the condition of absolute dependence upon *the singular shape* of the Unchangeable (par. 210). If it is physically necessary that *this* self-consciousness is a thing that can be sensibly seen, touched, heard, then it is logically necessary that the Absolute as self-consciousness is *eternally* seen, touched, heard; and to know God in this “shape” is to be able to see, touch, hear Him. The “faith” of the Christian is knowledge *an sich* (just as the embodied self is spiritual self-consciousness *an sich*).

We may be tempted to adopt the standpoint of Spirit *an und für sich*, and hence to say that this “faith” is *not yet* knowledge, *not yet* spiritual self-consciousness. But when we observe a Religion, we are observing the true infinite perfection or completeness of a *Gestalt* of Consciousness. The orthodox position has always been that “faith” is a *kind* of knowledge; in its “faith,” the Church of the Nicene Creed does know itself in God. The Church Militant knows itself to be one with the Church Triumphant; and Hegel knows how to express that knowledge for them philosophically. That (and only that) is “our contribution.”

That we are, indeed, speaking of the religion of the Unhappy Consciousness in its relation to the “shaped Unchangeable”—i.e., of the consciousness of being saved in Christ, as *this* historic Divine Man—is clear from Hegel’s remark about the Unhappy Consciousness of “actuality” being a negative consciousness of “loss.” In this time of “immediate” conversion, the saved Christian, loses the world. One who has not come to have the consciousness that the actual world is empty of all life and hope can hardly make the Christian leap of faith. The paradigm case here is Augustine. The unhappy consciousness of the actual world is the negative aspect of this immediate birth of Absolute Spirit as “Sense-Certainty”; religious life is bound to be (as it was for Augustine) a perpetual struggle not to fall back into spiritual despair. One has to recover, at every moment, the Pauline consciousness of the voice and the blinding light on the road to Damascus. That

Pauline consciousness is something that Augustine certainly had, and he founded a “Christian philosophy” upon it. *This actual man*, the Savior, is always there—even when I, here, am looking the wrong way.

This is the only way in which what Hegel says about “the belief of the world” can be reconciled with the present tense statement *of* the belief. Anyone who takes the present tense to refer simply to the Apostolic community must explain both why their actual sense-experience is called the “belief of the *world*,” and why the Nativity *needs* (and how it can have) such a remarkable audience in eager attendance upon it (in par. 754).²¹

(c) *Rational Revelation*

12./759. This incarnation of the divine essence is the simple content of the absolute religion. In it God is known as Spirit (and knows himself as such). Spirit is knowing oneself in one’s absolute otherness; it is knowing ourselves in God as our substance. So in this religion God is *revealed* as the absolute self in whom all selves know themselves. If there is true knowing this is how it must reveal itself. Orthodox theology is a mass of predicates that depend on this, and on the withdrawal into thought; but the concept of Spirit begins from the self-certainty of the self for whom it exists. It is the full self-consciousness of this self. *This* is the identity of divine and human nature.

That God is incarnate in humanity and “has essentially and immediately the shape of Self-Consciousness, is the simple content of the Absolute Religion.” This “simple content” is the concept of Absolute Spirit that must travel all the way from a sensible certainty which necessarily comes and goes like the Sun, to fully comprehensive self-possession. But the use of “immediately” in the company of “essentially” has an important implication which should be stated at once. “Self-Consciousness” has to travel all the way from the life and death struggle to the community of forgiveness; but in its immediacy it is the kind of self-awareness that the living man Jesus had; and it appears to me to be a rigorously necessary inference from what Hegel says that “the divine essence” has no other “self-consciousness” than this. The humanly “embodied shape” can say, as the Jesus of our record did, “I and the Father are one.” It will be a very naïve historian who says confidently that *this* record (in John) is “historic”; but only in the “oneness” that is here asserted (which our science seeks to explicate) can “the Father” properly be said to have “self-consciousness” at all. We, the observing readers, are the absolute authority concerning what “self-consciousness” is; and if “absolute religion” or “absolute knowledge” is even possible, then it does not use language in an analogical way, since no analogy is knowably “absolute.” The presence of God is a matter of Sense-Certainty because I too can say that “I and the Father are one.”²²

The religious encounter of two selves, which is the immediate shape of Absolute Spirit, is the complement of their encounter in the world. The self in whom God is actually recognized, refused to fight, and accepted the certainty of death willingly, rather than put the life of another self at risk. His God, in whom he knew himself

and all other selves, was a Substance whose accidents were all precious and essential. In the religious metaphor, this God sees the fall of every sparrow. He is Spinoza's "God or Nature," because Nature has already been recognized as the divine "Substance" that sustains all finite selves as its accidental aspect.

It is the structure of Consciousness (as the intentional awareness of an "object") that requires this universal Spirit to be known as *other*. There is not, and cannot be, anything hidden by its otherness; properly speaking, the Other is "the Father," i.e., the world of the reconciled community of all selves. It can become another "self," the object of an inward encounter, only as my own higher self, the embodiment of the perfectly reconciled community in me. Only in this way can I know God as a self, who is both other, and my own self. From the first moment that I have claimed to know anything, from the first moment of theoretical sense-certain consciousness, when I could say "It *is*," though I found it impossible to say what "it" was ("the contentless object of sensuous consciousness"—par. 757) my own selfhood has had this universal dimension. Now, through the mediation of a direct encounter with the Risen Savior, I can say that this universal dimension is God—that it is "I that is We and We that is I" (par. 177). My Sense-Certainty that "*It is*" has become the certainty that God is, as the absolute Spirit.

We must not forget the essentially communal character of Spirit when we read that "the absolute essence has the form of Self" or that "the Self is now the object of consciousness." God is *other* than I because he is "We"—and not any finite "We" but the Church Triumphant, including Zarathustra and Aristophanes and all the others whom we have recognized as we journeyed. But as Spirit I am other than myself, because I am this "We" also. Spirit is the whole *Begriff*, the "being-for-self" which necessarily is "for-another," yet "at home with itself" and "returned into itself" in this otherness. The "certainty" of self is the Cartesian certainty of "pure thinking"; but by showing it to be a religious, communally shared and maintained certainty, Hegel turns that "pure insight" into the strongest psychological *security* that selfhood can have. The "God" of the Manifest Religion is Jesus, the other self who is completely exposed, not hidden, yet whose "Mystic Body" is all the selves there are who have ever tried (or will ever try) to be properly human.

The God of the traditional theology has a mass of "predicates" attached to His subjectivity. He is the Good, the Holy, Creator of all things visible and invisible, and so on. But these "attributes" are not his essence; they belong to God as a thought-object. If we want to conceive Him as the Subject to whom these predicates attach, we must first manage to conceive Him consistently as a Subject at all (in terms of our own reflective awareness of what it is to be a "subject"). Only the spiritual concept of "subjectivity" makes it possible to do this at all; and God's being "the Creator of all things visible and invisible"²³—which comprehends most of the other "attributes" fairly adequately—will only be interpretable if we can first grasp how the Spirit creates *itself* "out of nothing."

13./760. Here the shape of consciousness (as the essence or truth) coincides with the self-consciousness whose object it is. The object in being signifies pure thought or absolute

essence. God seems thereby to have *come down*, but actually he has *gone up* to his true essence. For now he truly embraces the whole range of being. God as a sensible human mortal seems superficial, but it is now that He is at his deepest.

Here the objective shape of the “essence” as consciousness—i.e. the person of the Savior, or the “Shaped Unchangeable”—coincides with Self-Consciousness as Spirit. This man Jesus, who comprehends his world thoughtfully and is reconciled with it in action, is conscious of his union with the Most High (as the Understanding put it in the abstract theological tradition in which Jesus himself was educated). To all of the theologians coming from a pagan philosophical background—as much as to the Jews, or to a hybrid mind like Paul’s—this incarnation of God appeared to be self-humiliation on the most sublime and awe-inspiring scale.

Hegel himself needs the theological formula of *kenosis*, “self-emptying,” to express the transition from Substance to Subject. But he introduced his comments on the abstract thinking of the theologians in paragraph 759, because he means to have nothing to do with the language of “humiliation” as far as living self-consciousness is concerned. The actor is higher than his mask, even if he is not a hero; and the maid is higher than the fruit, even if she is no virgin. Similarly, the All-Highest is higher, as a *man*, than He was as the whole treasury of ideally intuited thoughts in the transfigured night of Gnostic Wisdom. For in the adequate concept of self-consciousness—present in a single person only *an sich*—everything will be logically comprehended and known for what it is. This includes such “pure thoughts” as “the All-Highest.”

The fact that death, too, is involved, that God has “humbled” Himself unto death in *this* man, is also crucially important to Hegel’s speculative theology. But we have not come to that yet. For the moment we are only saying that for Jesus to know himself in “the Father” was the greatest advance that “the Light-Essence” (or Hölderlin’s “Father Aether”) has yet made. Only in John 8:58, not in Exodus 3:14, does God properly say “I am.” Moses only heard a voice in a rapture of the imagination; Jesus said the words as God (and those who heard him were minded to stone him there and then). The sense-certainty of the embodied self is where all *spiritual* being is founded. Compared with it, the starry heavens (which filled Kant with awe) are only—as Hegel rudely said—a kind of sky-leprosy.²⁴

- 14./761. This consciousness is consciousness of God, not just of man. The manifest religion knows that the human being is God (essence). Self-consciousness involves both God and man at once. God is there in the spirit as my absolute self-consciousness. This is pure speculative knowledge, for that is what “spirit” is, and it is only in speculative knowing that God is. Speculative knowing is the identity of *this* self with the universal self. This was the truth of manifest religion, and that is why it is welcomed with joy.

In this seventh chapter of the *Phenomenology* we have followed the story of the manifestation of “the Lord” to the point where the structure of Self-Consciousness as Spirit has been grasped. In the Roman World the “Lord is come” indeed. The respectable North African peasant who had not the foggiest idea *who* the Lord of the

World was, was perfectly certain that he was somewhere out there, because his tax-gatherer arrived every year without fail.²⁵ For him, the illiterate fisherman recognizing Jesus as God was an easy model to follow. For a literate consciousness it was not so easy; for the absurdity of worshipping the living Lord of the World was patent.

Paragraph 761 shows us how and why the second position of the Unhappy Consciousness—the dependence of all finite consciousness upon the Shaped Unchangeable—has to transform itself into the third. Hegel spoke of the birth of the Manifest Religion in paragraph 758. He will return to the story of its development in paragraph 762. In these three intervening paragraphs he has been expounding the speculative Concept of it—the logically implicit goal of its development as we comprehend it. In its mature shape, the relation of *unequal* recognition is sublated, and the Concept is speculatively comprehended. The recognition of the Eternal Logos in the man Jesus, does away with the absolute gulf between the finite and the Infinite.

Even Peter's words "Thou art the Christ, the *Son* of the Most High" are, in themselves, a way of avoiding the evident absurdity of identifying the Unchangeable with a changeable "shape." It is only in the memory of a later age, when the doctrine of God's Tri-unity has been formulated, that Peter's declaration takes on the status of the paradigmatic leap. For Peter, the man who was there before him in the flesh, was the "mediator" between himself and God. It is only in the experience of receiving God's forgiveness through the words that this man speaks, that the three terms coincide for Peter, so that "God is here *manifest* in the way that He *is*; He is *there* in just the way that He *is*; He is *there* in just the way that He is *in Himself*; He is there as Spirit." The sense in which the theological doctrine is *not* a falsification of Peter's recognition-moment, is the key to the sense in which the absolved Unhappy Consciousness is a *Vorstellung* of Reason. But for the remembering consciousness the *Vorstellung* shows its religious meaning directly. The "belief of the World" takes Peter's words in their eternal sense, so that it also can say: "Thou art . . . the Son." In both cases, there is an identity of the mediated thought of the Divine, with the immediate (sensible) knowledge. But for the remembering consciousness, the immediate knowledge is that of an "inner sense."

Thus the Faith of the Manifest Religion is properly the third relationship of the Unhappy Consciousness with the Unchangeable. The Christ is *here*, now, as the reconciling word of forgiveness in His community. This is Reason in its immediacy; it appears to be the very opposite of rational, because it is immediate, and it involves the "eternity" of a transiently spoken word of forgiveness. It is also a sensible encounter, in an embodied community; the man to whom Peter spoke is *there now* immediately in the reconciling consciousness of mutual absolution (compare par. 671).

Only "speculative knowing," the observation that views both what moves and what abides in its eternal aspect, can see what happens here at all. So the object of our observation is now a consciousness only one step removed from our own. It is safe to say that Constantine's troops did not see their new God in this way at all; but Paul knew "God in the form of pure knowledge" already, in his conversion

experience. In Luther the thought, or the mediated knowledge, is fully explicit; and so it is, too, in Augustine's doctrine of the Inner Teacher.

Starting from the side of "immediate knowledge" we can easily recognize the speculative identity of opposites in the Johannine Jesus. "*Dasein* as the negativity of itself, and hence as self, *this* self and the universal one" translates "I and the Father are One," or "Whosoever has seen me has *seen* the Father." But the important sense of "immediate knowledge"—what really establishes the "*Wissen* of the manifest Religion" as "*pure* speculative *Wissen*"—is the fact that in the Pauline doctrine *all* of the faithful see Christ: "For now I live, yet not I, but Christ liveth in me" (Galatians 2:20; cf. John 14:9–11 etc.). This incorporation of the *remembered* Savior into "pure speculative Wissen" is God as Spirit. Questions about the historical accuracy of the Johannine record (or any record) of the man Jesus, fall away completely. There is no empirical doubt that could affect this experience; even the conviction that Paul was lying about his "conversion" would not touch it. We have to concede (abstractly) that anyone might be a "whited sepulchre"; but it is only an experience that is true *in itself*, an experience that we recognize because we have had it, we do have it, or we know (in the mode of "faith") that we *could* have it, that can be successfully "faked" for us by someone else.²⁶ It is only because we know what the "real" experience is, that we can distinguish it from a pretence.

This "speculative knowing," this recognition of ourselves in the *speculum*, the mirror, of the actual Savior who "is there"; or, more comprehensively, this recognition of the universal truth in the mirror of our concretely embodied, uniquely singular, and thoughtfully reflective, experience of ourselves as *selves*—this is the experience towards which "all the hopes and expectations of the preceding world were impelled." As we can see from paragraph 754, the "world" is that of the Unhappy Consciousness, the Hellenized world dominated by Rome. Unhappy Consciousness is swallowed up in the joy of the whole world over its "beholding itself in the absolute essence." Manifest Religion makes one point explicit, a point about that "*pure* self-recognition in absolute otherness" (par. 26) which was the definition of Spirit (and the Aether of Science) in the Preface. This can only come to birth through self-recognition in another self. For there to be this world of dawning philosophic science that Hegel lives in (and we also), it was therefore necessary that the "absolute essence" should be intuited first as an *immediate* self-consciousness. But for the immediacy to be "spiritual" it has to be the immediacy of memory, not that of sense. The Greek spirit could not be "absolute spirit," in any but a tragic sense of absolute striving, because the immediacy in which it recognized itself was a sensible one (cf. par. 27).

(d) *Evolution of the Rational Revelation*

- 15./762. This is the absolute self-concept of Spirit; but it has still to develop. It begins with the opposition of singular and universal self. It is the living man Jesus—who finds that the world does not recognize him. The Concept does not yet exist as Concept; and first Jesus must become the *image* of all selves. This will be the perceptual stage between the sensation and the understanding of spiritual selfhood.

Unless the manifestation of the actual concept of Spirit begins at the level of immediate sensibility, we shall have only a Gnostic fantasy. The memory of the eternally Risen Lord is the memory of an embodied human being who made a “living work of art” out of his active life (and death), and a “spiritual work of art” out of his speech. Memory now makes the “abstract work of art” out of the record. The whole “art” of this self was a peculiarly unHellenic (even anti-Hellenic) one. But he was a Beautiful Soul; and in its inward self-sufficiency, this “beauty” is *evil*. For that very reason the Passion of Christ was the *necessary* shape through which the “immediacy” of the finite living consciousness had to display itself as the “pure mediation or thinking.” Jesus was the martyr of an ideal of pure thought. He walked, talked, ate and slept like the rest of us; but always with the consciousness of being “One with the Father.” Unless he could manifest this “oneness” adequately, all of his living with it, but merely talking about it, would be hypocritical.²⁷

For those who heard his call and “followed” him in life, Jesus was “the Master”; the followers knew him as a model, as the athletic champion of a new life, but as another sensibly present human being. He was not present to them, or even to himself, as “spirit”; for there was no community of equals—except in the dream (like that of Novalis) which Hegel ascribed to Jesus in *The Spirit of Christianity*. The Spirit is still not there in the way that it is “*singular* self, just as much as it is universal, or as All Self.” “The Holy Spirit, the comforter” could come only when Jesus was dead; and then, as the Spirit of the Resurrected Lord, on whom all believers are dependent, this Spirit has only flipped over from the display of its singular side to the display of its universality. The Risen Lord is “the universality of actuality, the allness of the Self, and the exaltation of *Dasein* into representation.”

The dead Savior is a “*sublated sensible this*.” But that does not yet make him the truly universal Spirit. In order to reach the true universality of Understanding, Spirit must pass through a stage analogous to the “thinghood” of Perception. The spiritual “thinghood” of God comes about through the “exaltation of *Dasein*” in the Resurrection story. The identity of Jesus with “the Father” is here *pictured*. But in this picture he is far *less* like us, less equal with us, more remote, than he was when he walked the earth. The *Vorstellung* of the Risen Christ is the “Shaped Unchangeable.” This brings us to the “second relation” of Unhappy Consciousness (in par. 210), but not yet to the “universal joy” of paragraph 761. The symbol (i.e. the *Vorstellung*) for that is the “descent of the Spirit” at Pentecost.

- 16./763. Jesus must die, because it is the essence of sensible being to be transient; only as a memory is he spiritual. This is his *resurrection*. He is resurrected *in us* and thus we know ourselves as spirit, as a community whose substance is God, and which is the subjectivity of God. Thus the unity of the singular with the community is achieved.

We can begin to appreciate properly at this stage why Phrenology is so important for the phenomenology of Spirit. In order to become the *thinghood* of God, the Savior must die; like Yorick, he must lie in the grave as a set of bones. Hegel’s consistent emphasis on the symbol of the “skull,” the “Skull-place” (Golgotha,

Calvary), and so on, is in itself an explicit reflection upon the impossibility of the Resurrection as a physical event. But for the faithful in the “second relation” of Unhappy Consciousness the Resurrection of “the body” was a historic occurrence; and when Jesus returned to “the Father,” their human Savior took his ordinary perceptible body with him.

This has an important symbolic significance, but it is completely transformed in the “third relationship.” In the Faith that becomes speculative Reason, the “Body of Christ” is the religious community;²⁸ and the actual or *remembering* community, which knows itself in the religious totality of the Church Triumphant, must of necessity be embodied in flesh and blood. So, whereas the Crusaders (in the second relationship) fought for an empty Sepulchre, the Hegelian Christians (in the third relationship) know quite well that the natural body of Jesus had to be left in the grave where it long ago crumbled into dust, in order for the Christ to be resurrected in his spiritual body. The symbol of the “Ascension” does have a place in Hegel’s Christology, because the sensible body of the Church Militant rejoices precisely in its spiritual membership in the Church Triumphant. But the Ascension, like the Resurrection, was not a historical event. The Resurrection symbolizes the transition from a singular mortal body to a communal, and hence a perpetual or substantial, one; and the Ascension symbolizes the transition from a spiritually substantial community to the absolute spirit of communal subjectivity—the true immortality, or “Heaven,” of the Spirit that has left all the falsity of sensible being behind. Pentecost (the Descent of the Spirit) closes the circle and ties everything together, by admitting the equality of Subject and Substance and restoring to the “false” moment of natural, finite, sensible presence its permanently necessary place in the self-founding of the absolutely free Spirit.

Jesus dies; this changes his logical status. We are not at the moment interested in *how* he died, but only in how his “being dead” affects his relationship to the “belief of the world.” Having lain in the grave, he “rose” and was seen and touched again. Having “ascended,” he is now imaginatively *one* with the Father, because he has become “deathless.” All who “believe on him” can follow him through the gate of death into this deathless union with the Father. Thus, even in the second relationship—the “belief of the World” in Christ as Savior—the significance of the Resurrection, as a supposed historic event, is communal. But in the third relationship, the Body of which Jesus is the “head” becomes a present spiritual community. This changes the logical status of “the Father”; God is now clearly seen to be “the universal self-consciousness of the community.” Some who participated in “the belief of the World” at its birth, knew this already. The third relationship existed, in Paul’s conversion experience (and in those who understood it) from the time of Pentecost. But the nascent “belief of the world” was not generally on this Pauline level; the stage of spiritual “perception” was essential.

17./764. Temporal/spatial distance are an incomplete form of mediation for the immediate mode of spirit. Memory is only a formal baptism of sensible being in the water of the intellect.

The Risen and Ascended Lord is just a *Vorstellung* in the memory of the faithful. This is the stage at which the actual “belief of the world” appears. The *Dasein* of the absolute essence as an actual man is perfectly bounded. His life is over, and it ended far away, and a long time ago. We can have him with us now as an image (like the Greek statue); but the essential mode of his presence is that we read the records of his life (as in the “*spiritual* work of art”). How this *history*—this synthetic combination of sensible fact and intellectual meaning—can have the significance claimed for it by Faith, we still have to discover. “Remembering the story” is only a halfway house.

- 18./765. This form of *imagining* is the way in which Spirit is aware of itself in the religious *Gemeine*. The community’s consciousness is split into Here and Now and There and Then. The elements are all present but scattered. Consciousness must culturally develop its intuition of absolute substance into the fully self-conscious Concept that we have.

The “belief of the World” is all *Vorstellung*. Hegel said in paragraph 761 that “the joy of beholding itself in the absolute essence grips the whole world.” But it is a strange grip, even when the “whole world” of the Western Empire does become involved in it, for the “joy” of the *Gemeine* (commune) is essentially postponed.²⁹ “Unhappy Consciousness” and the “Joy of Salvation” are alienated “sides” of the actual world of Spirit’s Culture. The problem of how the historically singular *Vorstellung* can have a universal spiritual meaning is solved by *doubling* the world of experience into the world of fact and the world of thought. The world of thought is taken to be a real world of experience beyond death. Like the perceptual consciousness, the believing consciousness does not put the moments of its world together. It skips back and forth between “this world” and the “kingdom of God.” The moments of the historic *Vorstellung* that mediates this division are the Nativity, the Mission, the Passion, the Resurrection and the Ascension. They lie there in a string. It is clear that the ends of this string are very strange historic events indeed. But the imaginative interpretation of the thought here is that the Resurrection and Ascension are two stages of the entry into “eternal life” in another world. The ends of the string have still to be bent back to meet one another, so as to produce an intelligible whole with a meaning for Reason (which knows no “other world”). How this can be done we already know. But a long process of *Bildung* is required for it—fifteen hundred years if we reckon from the Conversion of Constantine to the appearance of Hegel’s book.

- 19./766. In this consciousness absolute spirit is the content as *truth*. But it must not be just a substance that is objectively imaged, but self-consciousness as an actual subject. This is its evolution in the community. We cannot discover what it means by going back to the life of the early Church, or to the words of the Savior. The historical *origin* of the concept is not the same as its logical simplicity.

Paragraph 766 explains the “cultural” transition from religious Perception to religious Understanding. The image of the Shaped Unchangeable, as a Savior who

has gone ahead to guide the faithful to eternal life, shows us how the Church as the Thinghood of Reason (the universal community of mankind) is necessarily constituted. The Church Triumphant is "Absolute Spirit as the content" because it is united with God, and the union is one of self-recognition in the other, or perfect self-knowledge. But this is a substance, the Heavenly City of Augustine, or the Ethical Substance with all of its tragic conflicts sublated. The Eumenides really do *become* the "Kindly Ones"; but this is only a picture of "pie in the sky." It must be translated into the experience of the community here, a real *subject*.

That was the problem of the Reformation; and ever since Luther (indeed even before him) there have been religious movements which sought to return to the condition of the first Christian community, the Apostolic community, in one way or another. But the problem cannot be solved in that way, because it belongs to the World-Spirit. Jesus himself withdrew from the world and formed his own community; but now that separated community has become the universal community. We have to imitate Jesus by "ascending into Heaven"; but that ascent must at the same time be the descent of the Spirit back to Earth. Hegel himself has "unravelling the rich life of Spirit in the community" in his book. But the goal of his memory-journey was not to return to the beginning, but to comprehend the whole that has sprung from that beginning. In this comprehension, everything is logically ordered; hence the Concept becomes "simple" in the sense that it is completely *transparent*; we can see why everything is now the way it is, or why it had to be the way it was. The beginning was "simple" only with the brute necessity of a natural fact: "He was crucified, dead and buried." That is simple enough. But then comes: "on the third day he rose again from the dead; he ascended into Heaven, and sitteth on the right hand of the Father." That is a mass of puzzles; and the community that took it for simple fact is not the one we want to go back to.

In so far as the "instinct to go to the Concept" leads the Christian follower to the ideal of a direct "imitation of Christ," this mistake is actually pernicious, because it leads to the "discarding of the *Vorstellung* of the community." This is the "evil" of the Beautiful Soul, in which even Jesus himself was involved. Instead of trying to go forward to Understanding, we try to get back from Perception to Sense-Certainty. The result is the death of religious consciousness altogether; *scholarship* takes the place of life.³⁰ Life must be lived in the community; instead of restricting the community and impoverishing life, a properly religious consciousness must enlarge and enrich it.

- 20./767. Spirit is initially *pure substance*. As thinking this descends into singularity, and passes into otherness (perceptual universality), in order to return to itself finally as self-consciousness. Perceptual determinacy is the necessary middle between pure thought and self-conscious subjectivity; but Spirit must spread out over all three moments.

Paragraph 767 lays out the conceptual pattern for the "understanding" of Spirit's manifestation. This is the maturity of the Manifest Religion. But since the standpoint should be that of the Belief of the World itself we must interpret the logical terminology in a way appropriate to that standpoint.

First, says Hegel, "Spirit is content of its consciousness in the form of *pure substance*." This "pure substance" is the God of scholastic theology, for surely the theologians are the "thinkers" of this community. "This element of thinking is the motion to descend into *Dasein* or singularity." It was Descartes, the scholastically educated "pure thinker," who discovered and demonstrated this "descent"; and it is Spinoza for whose consciousness this Substance is the content.

No theologian of the Schools taught the identity of God and Nature; but Hegel interpreted both the Trinity and the Mass in this way. His warrant for ascribing the view that God logically had to create the world and become incarnate in it, to the consciousness that we are observing is probably to be found in Boehme. Boehme is certainly Hegel's main model of theological thought in the mode of *Vorstellung*.³¹ He truly thinks in images, and every act of his God is creatively *imagined*.

"The third [moment] is the return out of *Vorstellung* and otherness, or the element of self-consciousness itself." This is the theological conception of the Holy Spirit. The Spirit "proceeds from the Father, and from the Son." So it is the result of the motion, the result which cannot be separated from the motion that is its self-production. The Incarnation of the Logos in the *Vorstellung* of the God-Man is only one of the moments of the religion of the Spirit—vitally necessary, but not sufficient by itself, to complete its cyclic process. The community of the Spirit will give quite a different interpretation to it than that which was given by the Belief of the World (for which it had simple historic truth).

Each of these moments constitutes a world. To the Unhappy Consciousness belongs the world of "pure thought"; to Faith belongs the world of *Vorstellung*; and to Religious Self-Consciousness belongs the world of Spirit proper. They are a moving cycle and each contains its predecessor(s), so it is not surprising that they flow into one another, and that any periodization is artificial.

- 21./768. We have met this content partially in the shapes of the *Unhappy Consciousness* and *Faith*. But in the former it was brought forth only as an ideal for consciousness to yearn after; and in *Faith* the content is the imaged essence of the world, but without a self, and without actuality, hence without self-certainty (which is sundered from it partly as a vanity of knowing [cf. pars. 525–526?] and partly as pure insight [cf. pars. 541ff.]).

From the way that Hegel has spoken about them previously, we might well think that Unhappy Consciousness and Faith are identical by continuity. It is the Unhappy Consciousness that comes to Faith, we might say; and it is distinct from the Faithful Consciousness only in its "first relationship." But Hegel devotes paragraph 768 to clarifying the distinction between them. The fact that Unhappy Consciousness appears among the singular *Gestalten* of consciousness is crucial. It is a subjective yearning towards a Kingdom brought forth from "pure" consciousness, which remains completely beyond all empirical consciousness. Thus the salvation of Unhappy Consciousness is a matter of "grace," because it is not yet "Reason"; it is not yet "its own content *an sich*, or as its *Substance*." Reason knows itself to be identical with its actual world; and Faith is a mode of Reason. The world is its substance.

The Unhappy Consciousness is also an *actual* world-condition; but as a shape of Religion it is only subjective not objective. The Unhappy Consciousness can never be at home (as Faith can) in the actual world in which it finds itself. It achieves salvation only authoritatively, by a final act of self-alienation, the alienation of its own powers of speech, decision and will. Faith, on the other hand, knows that its duty and destiny is in this world. The content is for it “the selfless *essence* of the world”; it is quite “objective.” It appears to me to follow that for Faith, salvation is *by works*; and if we take that to be Hegel’s meaning, then it is easy to see how Faith is a mode of Reason. “The Faith of the world”—Hegel used the word for “Faith” in paragraph 758—begins as the Unhappy Consciousness saved, and only publicly arrives at Faith (in Hegel’s technical sense) with the Reformation. Paul, and no doubt many readers after him, were already “faithful”; while, on the other hand, much of Luther’s theological doctrine is essentially “unhappy” (he was a great doer of God’s work, but no believer in “salvation by works”). But for the *Weltgeist* itself, Constantine and Luther seem to be the best markers of the saved Unhappy Consciousness, and of Faith. With Constantine again, it may seem paradoxical that he conquers and rules the world, but does not have it as his “substance” *an sich*. But logically he was only an atomic singular self in the Condition of Right (like the madmen Caligula and Elagabalus, or the blood-stained tyrant Caracalla); and empirically it is not our concern whether his sights were set on Heaven as “beyond” or as “within.”

But Faith is also said by Hegel to be a *Vorstellung*, an imagining, which “escapes from actuality altogether, and hence is without the *certainty of Self-Consciousness*.” At this point, Hegel himself is caught up in the essentially contradictory character of all *Vorstellen*. Faith’s “objective content” is not a community in this world, but only in the eternal world of pure thought. Faith encounters God (as Spirit) “within”; but in the actual world there is only the cultural labor of self-reformation. In the struggle between Faith and Insight, it is Insight that has Reason’s self-certainty. Yet Faith knows that the Enlightened picture of it as superstition is only a travesty of its content. It is defeated by Insight, because it does not properly recognize its own rationality. It can only formulate its content as a *Vorstellung*. Thus, the paradox of Constantine ruling the world, while having no intellectual place in it, and that of Luther emptying the monasteries and proclaiming the “witness of the Spirit” now and here, while still *yearning* for a Heaven of promise—these paradoxes do express the contradictory character of both Unhappy Consciousness and Faith as modes of *Vorstellung*.

Vorstellen is an incompetent, and hence a contradictory, mode of thinking. It achieves competence and clarity only in the “shattered” language of Young Rameau. Pure Insight, which has the self-certainty of Reason, gets involved in contradiction just as Faith does, because it too can only think in pictures. It pictures a Heaven on Earth, and it creates Hell. Reason operates in Concepts, but as Pure Insight it has no content; it distinguishes itself from Faith by its this-worldliness. Finite Reason thinks it can dispense with Religion, but this is only the “vanity of knowing.” As a singular *Gestalt* Reason has no “substance”; and whether as theoretical observation,

or as self-actualizing, or as self-sufficiently real, it discovers only its own vanity. Only in the self-conscious community of Spirit, the community from which the transition to Religion was made, and to which Religion will return at its climax, are Self-Certainty and Substance properly reconciled.

(e) *The Manifest Religion of Reason i: Logic*

- 22./769. Spirit as substance is imaged as eternal essence, but with the meaning of spirit. But spirit is essentially actual, i.e. it must express itself, *utter* itself. Simple essence (truth) as abstraction is essentially self-negating thought, i.e. it is the self-concept. Imagining grasps this necessary transition as a *begetting*.

The doctrine of the Trinity is the logical expression in a *Vorstellung* of the concept of Spirit as self-actualizing self-knowledge.³² As an abstract concept it is an identical eternal essence (the Unchangeable, as Augustine called it). But this essence is the essence of Spirit. This is portrayed by calling it “Father”; but all that it can be “the father” of, is itself as other—so the name designates the necessity of its self-actualization. It “begets” itself as “the Son.”

This is just an imaginative portrayal of the speculative that constitutes its own *being*. I think “pure Being”; but as my thinking, it is only for me; as pure Being however, it means what is not a mere object of thinking; it must be a self-thinking Being, i.e., self-negative or a *pure* thinking that is universal, one that comprehends all otherness. In other words, Pure Being thinks *itself* as the totality. But it cannot think itself simply as itself. It is for itself; and without being for itself *really*, i.e. as another self, it cannot think truly at all. So by the same token, the other self is identical with the “Father.” Hence both the Father and the Son are “returned into themselves in this otherness.” This is the fulfilment of selfhood in the “procession of the Spirit.”

One cannot say any more than this about the Trinity as “thought,” except to warn that the doctrine is not meant to be deep or difficult. It is philosophical logic at the level of immediate inference; but no one practices it in formal abstraction. What “Selfhood” is, we learn in experience; and even when we have learned empirically that we are “members one of another,” it seems to us paradoxical rather than “logical.” So it is a long time before we can see that the Trinity is just the logic of it.

- 23./770. But what is begotten also knows and is known as the Father. Thus we have three moments, Father (Essence), Son (Being-for-itself), Spirit (Consciousness of being for self as being for other, and vice versa). The relation of Father/Son is that of Speaker/Word. The Speaker is emptied into the Word; but it is only there because the Word is *heard* as spoken.

The elementary logic lesson continues. The concept of free spirit as “self-realization out of nothing” has three moments: the definition itself, as *essence*; self-positing, as what is real *for* the essential self; and self-recognition in the reality posited. As an abstract thought, this conception of God as “pure thinking” lacks all the multiplicity and variety of the other consciousnesses, the distinctions that enable us

to recognize (both in the others, and in ourselves) the complex union of sameness and difference. We are unique individuals, because we are both absolutely the same as, and infinitely different from, one another. There is nothing that we cannot share, but also we cannot come to the end of what is not shared.

In order to be *concrete*, the Divine Spirit must comprehend this multiplicity also; hence the Incarnation is a necessary doctrine. God (as the unity of Essence) must be emptied out into the multiplicity of consciousnesses. The “otherness” of the Son must be the otherness of the language in which we express ourselves, and through which we comprehend others. When I *utter* my truth as well as I can, I am, for the moment, *emptied*. I may already be thinking of something new to say; but I am prepared to defend or amplify what I have already said, because it is *me*. This is the experience upon which Hegel’s concept of “creation” is founded; and the Creation is, for him, the begetting of the Logos, and the beginning of the Incarnation. Like the Light-Essence (or the Theban Saga) the Christian Creed is important only because it provides the forms in which our community expresses its absolute convictions; and the task of the philosopher is to lay out the rational structure of the actual world in which she lives and thinks. This structure is embedded in the universally shared commitments of religious belief. Where there are serious differences of commitment, some philosophical problems may arise. But one can be completely “irreligious” (in the sense of being without “Faith”) and still follow Hegel’s argument with full agreement (or sometimes with critical disagreement). “Faith” is belief in the *Vorstellung* as a *Vorstellung*. Hegel is (or at least he aspires to be) completely beyond Faith in that sense; he does not believe in Father, Son, Spirit, Creation or Incarnation, except as logical moments of the rational community, for whom he is interpreting these traditions. The logical moments, and the community, he does not *need* to believe in; for in so far as he aims to do, and thinks that he is successfully doing, the *logic* of rational experience, he *knows* these concepts to be “true.” They are the logical concepts that realize and confirm themselves in a fully coherent conception of experience; and one can be as “enlightened” as D’Holbach and Voltaire (or Marx)—holding firmly to the precept “Ecrasez l’infame”—and still agree with what Hegel found in the *Vorstellungen* of Christian faith.

- 24./771. So the absolute essence is properly *Spirit*. But for imagination the moments are distinct, and are known to us only by revelation from elsewhere. This externality of presentation must be overcome. The instinctive attitude of Reason is one of simple rejection, but this impulse must not finally triumph [cf. par. 766 for the instinct of faith]. Speculative truth must not be mistaken for history, when the merely historic is thrown out.

Hegel’s interpretation of the Spirit shows why there logically have to be “three Persons in one Substance.” We can now see that his proclamations about the final comprehensiveness of the concept of God as “Spirit” involves the doctrine of the Trinity as a whole. Unless the moments of the Trinity are conceived as “this motion circling within itself [or into itself]”—and “grasped in their purity, as the

restless concepts whose being is only to be in themselves their own counterpart”—we shall have only the “Supreme Essence” of the Enlightenment on one side, and the edifying but empty word “Spirit” on the other.

Vorstellung, or the thoughtfully imaginative capacity of the religious community, cannot cope with this dialectical identity of opposites in the comprehensive concept of Spirit adequately. It represents the conceptual necessity and order of the terms: pure thinking, sensible representation, speculative self-consciousness (see par. 767) as a relation of natural production and dependence (Father/Son). The spiritual community of the two is an addition superimposed upon this image; and it contradicts the implied dependence-relation.

Early Christian communities disputed whether the Spirit “proceeded” from the Son, or only from the Father; and it is certainly difficult, in any case, to find the equality-structure of the three “Persons” in the New Testament at all. Yet the whole doctrine was accepted as a “revelation,” (in the transcendent, supra-rational sense which belongs to “Unhappy Consciousness,” and which Hegel hardly ever employs) in spite of the evident fact that it had to be thoughtfully constructed. It had to be accepted as a “revelation” because it is a mass of formal contradictions, and it has always been taught (or rather, imposed upon the minds of the faithful as a verbal formula) as an incomprehensible mystery. Abelard’s attempt to explicate it brought him to public humiliation in the twelfth century; and it was involved in the downfall of those philosophical heretics Bruno and Campanella five centuries later. Catholic philosophers and dogmatists may be interested in Hegel’s interpretation *now*; and some were sympathetically inclined in his own day. But the Church has always been, and still is, suspicious of rationalizing interpretations.

What Hegel says about the “instinctive compulsion [*Drängen*]” of the *Begriff* needs to be studied carefully. One aspect of the “instinct of Reason” is the compulsion to trust our own “insight,” even when the only available formalization of our “reasoning” is visibly invalid. Thus the observer says “All crows are black” and “All swans are white”; and even when we find that we were actually mistaken about the swans, we do not lose our faith in the blackness of all crows. But the instinct to trust “insight” which can cause us to accept what is *not* logical, must equally cause us to reject what is illogical in the strong sense of being contradictory. We also have an instinct, however, which tells us that both sides of a contradiction can contain truth. This is the instinct to “go to the Concept” mentioned in paragraph 766. It is not an instinct to go against “insight,” but an instinct to avoid choosing between the contradictory “sides.” In paragraph 766 Faith was seeking to avoid all the contradictions of modern life, by turning away from it like the primitive Church. This example shows that Faith is just as fallible as Insight; but the instinct to go to the Concept is the *real* “instinct of Reason.” We have to understand the need speculatively, by comprehending how the Concept unites both sides of the contradiction. Thus the speculative instinct contains the logical instinct of “Insight” to reject contradiction, but it tells us that the avoidance must not be by a simple choice of one side. Reason in all its forms rejects the imposed acceptance of contradiction by social authority.

Hegel does not have to worry about the shadow of the Inquisition. He has to be concerned more with the determination of the Enlighteners to wipe out “superstition”; and his position is that the dogma of a transcendent “mystery” is unquestionably superstitious, but that speculative Reason can find here the most fundamental of all religious truths, as soon as the garb of an authoritative “mystery” is torn off. The attitude of D’Holbach is more misguided than that of Faith; but his attack was needed in order to make Faith properly “thoughtful,” and eventually “self-conscious.” Hegel’s own interpretation responds to the *Drängen*, the compelling drive, of the Concept, in order to produce this result.³³

- 25./772. Absolute spirit, imagined as pure essence, has the defect of being an object, or an “other.” But Spirit is the motion of self-othering, so this “otherness” is a distinction without difference. God as spirit is God as *love*.

“Imagined in its pure essence,” says Hegel, “the absolute Spirit is not, of course, the *abstract* pure essence.” The *abstract* pure essence is the simple power of thought to express itself as *Vorstellung*—i.e. it is the creative imagination dealt with in paragraph 756. But “absolute Spirit” is not an “abstract” essence, because the belief of the world is that in the Birth, Mission, Passion, Death, Resurrection and Ascension of Christ, and finally in the Descent of the Spirit at Pentecost, the absolute Spirit appeared. Out of these events the dogma of the Trinity has been constructed.

Hegel now wants us to consider the “unity” of this Trinity. The simple “oneness” of the Father and the Son in the Spirit is a union of *Love*. This Love is an immediate mode of Self-Consciousness in which there is identity without difference. Christ in Heaven is directly identical with the Father. He is the Logos “by which all things were made”; but that does not set up any antithesis between the two Persons. It is the nature of the Father (as pure thinking) to be expressed in Creation (as *Vorstellung*).

Again we should underline the fact that Hegel’s theology is strictly a matter of conceptual reasoning, and hence it is not orthodox. The supposed “freedom” of God not to manifest Himself in Creation, and His supposed “self-sufficiency” in independence of what He has created, are dialectical illusions generated by the logical contingency that is inevitable in the presentation of thought as *Vorstellung*. Because of the radical contingency of the “othering” of free thinking, the order of Nature must have an aspect of brutally irrational “thereness.” This is part of the philosophical meaning of the assertion that it is “created.” “The Idea *resolves* to let itself go as Nature”; it is *real* difference, the radical antithesis between Infinity and the finite.

To suppose that this contingency could attach to the self-actualizing of the Concept would be absurd: “Without the world, God is not God.”³⁴ The world in its finite multiplicity is certainly other than God; but the human consciousness of it is the “appearing” of God as “essence.” This appearing is a conceptually necessary moment of the “essence”; as the “Word” of Creation, the human “spirit” is the self-othering of God himself. The relation between them is that of concrete

cognition, i.e. of a “beholding” that is recognition. This self-recognition is “the intellectual love of God.” In the mode of *Vorstellung* it is pictured as “the Spirit proceeding from both Father and Son,” and so bringing them back to their essential unity.

(f) *The Religion of Reason ii: Creation*

- 26./773. This otherness of pure thought must pass over into otherness of existence. Against Heaven there must be Earth—the realm of *Vorstellung*.

The purely logical distinction between Being and Knowing, which is religiously expressed as the identity of Divine Love, must be an *actual* distinction if there is to be actual love, real knowledge and an actual spirit proceeding between the two ideal terms. Until he reached the last sentence of paragraph 772 Hegel was still expounding the Trinity “in itself.” This is the “kingdom of the Father”: Logic, or the life of God as eternal. It is conceptually necessary that there must be otherness sublated in loving recognition, if God is to be “Spirit” even in thought. But the actuality of Spirit involves a more radical kind of otherness; against the simplicity of pure thinking there must now be set the multiplicity of the world of *Vorstellung*; the world of singular things, actual and possible, is itself *necessary*—even though nothing in it, except lawfulness, is absolutely predictable. The theological distinction between Heaven and Earth expresses the real “otherness” of Father and Son. The “Son” is incarnated in his community; and in this way both he and the Father become really independent “Subjects.” The dogma of “Creation” spells out the logical consequences of this real differentiation, in a theological *Vorstellung*.³⁵

- 27./774. So God must “create” the world. This is a way of *imagining* the logic of self-othering, and of expressing the fact that the world can only exist *for* the self.

The speculative interpretation of “Creation” is that it is an imaginative way of expressing the logical necessity that pure thinking has to find itself *mirrored* in a world of communicating selves, if there is to be any self-conscious rationality. In this sense “Creation” is necessary, even though nothing that is known as *created* can be logically necessary. From the logical point of view, “Creation” is an arbitrary “resolve.” The “resolution” of the Idea to “let itself go as Nature” is just as *eternal* as the logical Idea itself, being a necessary moment of the Idea itself.³⁶ To call it a “free resolve” is only to say that there is no “reason why things are the way they are, and not otherwise” except for the extremely general necessity that the empirical order must be such that self-consciousness can securely subsist in it. Self-Consciousness must have a *world* in which to be self-conscious. Self-consciousness exists; therefore, speaking theologically, God had to create the world.

It helps here to remember that “God,” or the Divine, is just the name for the categorical structure of self-consciousness that is communally recognized to be necessary. In its “religion,” the community *knows* (portrays to itself) its own basic

interpretation of life in the world, and of its relation to the world; so the whole perspective of “theological” language is upside down. The “manifest” religion is the shape of world-consciousness in which that inversion is finally in the process of being corrected. The dogma of “Creation” is a “mythical” way of describing the freedom that we have in the interpretation of the world—which would not be a “world” at all if it did not have a *necessary* structure. The concept of “Reason” as the universally self-conscious (or “scientific”) community interpreting the world rationally, is what all of Hegel’s interpretations of religious *Vorstellungen* are derived from. Christianity is for him the “absolute” or “manifest” religion, precisely because the dogma of the Incarnation provides the foundation for an interpretation of religious language that is coherent with our scientific uncovering of what religious experience is.

No matter what the Christian theologians may continue to *say* about the transcendence of God, about His freedom in Creation, and about His merciful grace in choosing to “reveal” Himself, their Creed contains the essential admissions through which we can show that it is the logical necessity of the Christian God’s nature to manifest Himself to His “creatures.” Unless He creates finite beings and manifests Himself to them He cannot be the Christian God—the God who is “Love”—at all. Once we get to the point of admitting this, it is also plain that the “nature” of God is logically dictated by the community that worships Him. We have now reached a mode of religious experience that is self-consciously aware of what we have scientifically shown “Religion” itself to be. We can now invert all of the dogmas of the Creed by reading them as the self-definitive knowledge of the community. Thus, in the ordinary sense of “create,” it is not God who “creates the world”; it is *we* who create the scientific *interpretation* of it.³⁷

- 28./775. In this created world finite spirit is present as the singular self—hence not yet as spirit. It is “innocent,” and must withdraw itself from this natural existence by knowing itself, by thinking. As determinately selfish this immediate knowing is evil as opposed to good. This necessary Fall is pictured as an accident of choice.

Just as Creation was not a gratuitous act, or an arbitrarily free choice, so the Fall of Man did not result from a sinful act of disobedience or pride. The story of the Fall is a *myth* that expresses the logical necessity of the Spirit’s turning away from the natural world within which it comes to birth, and leaving it behind. Spirit must assert its absolute freedom as finite self-assertion, in order to return to itself as Absolute Spirit. So we can say, if we want to, that “without Adam’s sin, God would not be God.” But I trust that, by now, the repetition of that sort of paradox is superfluous.

The human being as she comes into the physical world is simply a middle-sized mammal. Whether the healthy baby, protesting lustily against the world, is ever really “innocent” I shall leave the empirical interpreters of depth psychology to argue about. Hegel has earlier concerned himself with the “innocence” of the natural community; and any student of the Greek myths knows how *metaphysical* that “innocence” was. Now he speaks of the “singular” spirit; and we know that the

“first experience” of that natural self is a battle to the death. But before it can enter upon that test, self-consciousness has to gather itself out of the dreamy dispersal of sensible contemplation into the Baconian knowledge of the practical Understanding. It is hard to find “sin” in this self-gathering. But it is, by definition, *selfish* and self-assertive; that was the dialectical Nemesis of Enlightened utilitarianism. The Enlighteners could not create an Earthly Paradise; and the Terror was the manifestation of the “angel with a fiery sword.”

Hegel is very conscious of the moral dimension of the myth. The Tree bears the “knowledge of Good and Evil” as its fruit. In another context he compared Eve’s apple with that of Newton.³⁸ The comparison was to the detriment of Newton’s experimental philosophy. There is no knowledge of “the Good” in that. The Baconian knowledge that is power is selfish (and hence evil). The proper (*ethical*) temptation referred to in the Eden myth, depends upon the experience of the community of “True Spirit” as the Good; and the full speculative exposition of it belongs to the moment where the individual emerges from the wreck of Greek political life as a military conqueror. At that point, “Eve” was only a speculative *symbol* for the family, and for the dynastic interest that any such conqueror must have. The initiative of selfish imperialism is clearly *masculine*. So, in my opinion, it is a logical improvement, to leave Eve out of the story altogether, as Hegel does here. In the Greek myth both Creon and Antigone are “innocent sinners”; and it is their community that gains “knowledge” (so far as the knowledge of good and evil is possible for them). But if we imagine both Antigone and Creon to be endowed with a living awareness of the *opposed* “law” we can see why the primitive condition of human spiritual self-consciousness is a fall from innocence into the unhappy consciousness of “good and evil.” Tragic conflict is inescapable. We have seen why it must arise.

- 29./776. Evil is necessarily the *first* state of self-knowledge; but the Good is still present in thought. So the necessity of this opposition is imaged as a fall in Heaven itself. [Boehme’s] Son of Light fell (and another son was begotten in his place). But “fell” and “Son of” do not belong to conceptual thought; the image of a community of angels (as the otherness of the Concept) is appropriate; so the fall can start there. Thus instead of a Trinity we could have a theological quaternity or quinity if we liked. It is *all* one anyway, so counting is silly. One/Many says all.

The consciousness that is primitively aware of itself as *evil* (or “sinful”) is the Unhappy Consciousness. The Christian universalization of Adam’s sin, and the corresponding doctrine of the universal need of God’s grace, was what made the Gospel into the perfectly apt response to the stage that the World-Spirit had reached. The Gods had “flown” from the world, and a completely “gracious” God must be found in the newly independent realm of pure thought.

The evolution of thought as an independent realm is bound to begin with the awareness of “nature” as *essentially* fallen. For as long as there is a *good* “state of nature” which we can achieve (or to which we can return) that is what we are logically obliged to think about. We can only be faced with the fact that natural harmony

is not for us, when we know that the true Good is something else altogether; and then we are bound to be “fallen” in our own thought, if the true Good is present in our thought as well. So one result of the polarization of Being and Thought, and the abandonment of the aesthetic or intuitive conception of thinking as the creation of beautiful being, was that the Christian preachers invented a spirit who had never existed before: the Spirit of Evil.³⁹ The Greek gods (and the gods of Hellenistic paganism) were jealous and easily offended (like Yahweh). But none of them was essentially malevolent or *evil*. Apollo denounces the Furies in highly moral terms; but Athena gives them their place under the throne of Zeus as agents of divine justice. In the Jewish tradition even Satan is a servant of God. Dante’s Satan (or Boehme’s Lucifer) is a different being altogether.

As I have both said and shown, “the knowledge of Good and Evil” is directly constitutive of the Unhappy Consciousness. But we must here look at the actual world of that consciousness; that actual world is “fallen.” In the “second relationship” the evolution of “Faith” begins. In the *Denken* of Faith, spiritual beings are projected *immediately*; they are imagined as beings like the ones who “are there” in our sensible world. The supreme master of this projective thinking is Dante. But in his Religion chapter, Hegel offers us Boehme as the paradigm for it. This is appropriate both because it is the German Lutheran religious consciousness that he wants to transform; and because we can recognize the movement towards “self-consciousness” in Boehme. His theology is truly prepared for, and apt to Hegel’s interpretation of it.⁴⁰

It is Boehme’s myth that Lucifer was the First Born Son, that he fell because he was self-obsessed, and he was replaced by Jesus Christ.⁴¹ Hegel’s speculative conception of the creative Incarnation of the Logos requires the reconciliation of the “evil” principle of self-assertion with the “good” principle of duty and sacrifice. We have seen how this reconciliation is achieved in “Evil and Forgiveness” (pars. 660–671). Boehme’s conception of God as moving from the “dark centre” to the “light centre” was a theological *Vorstellung* for this. The Christian God could not be “Love,” and the absolute fount of mercy and forgiveness, if He did not comprehend “evil” as a necessary moment of his own being. Even the authoritative “absolution” of the Unhappy Consciousness depends upon this. But it cannot be represented at the level of *Vorstellung* without the emergence of some appalling paradoxes.

For the moment Hegel merely insists that multiplication and plurality will not solve the problem of evil. The NeoPlatonists tried to solve the problem of the One and the Many by imagining the metaphysical “Fall” as a series of *lower spheres*, ending in our sublunar world of perishable matter. These spheres were controlled by angelic intelligences. Dante made a consistent use of this schema. But it does not help anything—any more than the simpler *Vorstellung* of a community of “fallen angels” does. Only the idea of “community” is speculatively relevant and must be retained.

The Logos is incarnated in a world that does not comprehend him. The Passion is an image of “reconciliation with evil.” Inasmuch as the principles of “Heaven” and “Earth” must be opposed, one can count *four* necessary moments in the pro-

cess of the Spirit (Father, Son, Spirit, Evil Spirit); and inasmuch as there are those who “hear the Word” even on earth one can count five. But it is interesting to see that Hegel is not concerned with how many distinguishable moments there are. His logical triad is a categorical *order*. There is the One Being; and secondly, there are (natural) essences; and thirdly there are (spiritual) relationships. In the sphere of *Vorstellung* there might be any number of beings and spirits. Boehme’s “theosophy” has several sacred numbers; and all that this shows is that numbers are not sacred. It is the whole sphere of *Vorstellung* (as *one* thought-determination) that is logically necessary; and that is the sphere of “number” as indefinite (i.e., the sphere of the “bad infinite”).

- 30./777. Thus man is a helpless battleground of the good and evil powers. But the self is their actuality, so Good must appear as a self too; according to the image God humbles himself willingly. That “evil” is God’s own pride or His “wrath,” is the hardest thing to image; and the effort is fruitless without the achievement of the Concept.

We have to go back to paragraph 775 to discover and confirm the proposition that “*Good* and *Evil* were the determinate distinctions of thought that emerged.”⁴² In paragraph 775 the “Creation” is treated as the “external casting out” of the Spirit into “completeness and its outward order”; and the self is present as the natural consciousness of the rational organism in its environment. The withdrawal into self-consciousness is the birth of self-assertion, the birth of the ambition for lordship. Thus the first purely conceptual knowledge (as opposed, for example, to the aesthetically realized cognition that is symbolized by Adam’s “naming of the animals”) is the knowledge of the “evil” self, as opposed to the aesthetic harmony of life that is “good.” To be self-consciously independent of nature is the “original sin.”

The Christian consciousness has been expelled from the paradise of nature for this “sin.” The Unhappy Consciousness of being cast out into a natural order that is a world of servitude and toil, and of being “sinful” in seeking happiness there, is the primitive field or “element” of Christian religious experience. “Good” and “Evil” are ideals of thought now, whereas they were concrete realities for Creon and Antigone. Evil is *imagined* as Adam who *fell*, and Good as Christ the Savior who freely came down from Heaven. The evils of the world which are the “wrath of God” and the punishment for our sins are all done away, because the Savior, God Himself, has taken the original sin upon Himself, and is reconciled with evil. The reconciliation is imaginatively logical: God becomes a Self (the original sin), and suffers the extreme of the “wrath” by which that sin was punished.

This is a *Vorstellung*, a thought-image of why evil, as aggression and passion, is necessary for the achievement of rational self-consciousness. Evil is the blind movement of singular self-assertion, which finally recognizes its own *spiritual* character as the self that is born from, lives in and returns to, the rational community. If the cycle did not begin in a natural organism, with its exclusive needs, and its selfish urge for dominance and “independence,” the human community could never come to be a community of “individuals”; or in other words it could not come to be

as a self-conscious community, since the individual is the “concrete universal,” the self-consciousness that is both singular and communal.

This necessity of “evil” cannot be successfully *vorgestellt*. The figures in Dante’s *Paradise* are marvellously individuated; but no one can say what that individuation means when we reach the true Paradise of the Rose. We can visualize well enough what it means to be a “sundered self” in Hell; but not what it means to be united with God. The “result” is separated from the “process” (as it must be in a *Vorstellung*). Boehme made the supreme effort, but once God and Satan have been *pictured*, their identity is impossible to accept.⁴³

- 31./778. Thus the estrangement of God is posited in its two forms: finite selfhood, and infinity of thought. The sides are unequal. First God is what counts and man and nature should be sublated; then man is what counts, and simple divinity is unessential. “Thereness” (as what is common) is their still empty middle.

God Himself must be reconciled with His finite human creature. That is the *theological* proposition. But the necessity is a logical one; it exists in the thought of the “creature.” It is the finite mortal whose self-consciousness is logically the first moment. God is a thought; He becomes a self only through Incarnation. In this there are two moments. The first is *vorgestellt* in the Passion of Christ (which the Unhappy Consciousness seeks to imitate or emulate, but without actually *dying*). Here the finite self sacrifices itself for the sake of “union with the Father.”

Then comes the reverse movement. God sacrifices *Himself* for the deification of the finite self. This is symbolized in the Resurrection and Ascension; but it is the Crucifixion that is the crucial moment in Hegel’s doctrine of the Incarnation. On the Cross, man and God both die; they give themselves up to one another; this is how the *real* “Incarnation of God” begins. The carpenter’s son is an ordinary human being; the Bethlehem myth means the opposite of what it seems to say, for it is the *death* of this man, not his birth, that is the moment of God’s self-emptying.

“Their still empty middle is *thereness* in general, the bare communality of their two moments.” If we take the theological reference to be to the moment when Jesus said “It is finished” on Calvary, then the *middle* is certainly empty. What God and Man share is death; we should recall the empty climax of the mortal struggle of natural self-consciousness, where only death can successfully demonstrate *freedom*. That moment can be filled with a spiritual meaning because it is *remembered* by the community that observes the battle. Now the whole world is the remembering audience for the reciprocal sacrifice on Calvary.

It is rather difficult, however, to decide just how the “content” of the social “remembering” should be located and described. The two moments are so abstract that we can interpret them in many ways. Thus, for instance (in the perspective of “the world’s belief” itself) we can think of the “first” and the “second” Adam (the second being Christ himself). Calvary divides the “Kingdom of the Father”—the period of the “divine Right” of God’s law—from the “Kingdom of the Son”—the period of the “absolute Right” of the human self.

This is how Faith (as “the belief of the World”) sees things; and perhaps, in this present, rather abstractly theological context, we should look no further. But I cannot help feeling that a more dialectical interpretation (one in which the moments are not simply separated) is in Hegel’s mind. His “Science of Experience” is concerned with the world of the “second Adam” rather than with that of the first. So we should probably confine ourselves to that, and take the Reformation as our dividing marker. The world from Constantine to the Crusades used the imitation of the Passion as a kind of guiding star. As Hegel points out, the moment of God’s sacrifice for the use and enjoyment of the independent *self* was not absent then (see par. 220); but it was rather under a cloud.

On the other hand, the Insight that attacks Faith as superstition reduces the “absolute essence” of thought to a merely instrumental status. The Baconian gospel that “Human knowledge and human power meet in one” proclaims our return to the Garden of Eden, or the establishment of Heaven on Earth. First, the Age of Faith and the Age of Reason succeed one another in the field of “*Dasein* in general” which they share. But in the Age of Reason the two moments share the field of *Dasein* visibly. They are the poles of “the World of Spirit in Self-Estrangement.” If I am not mistaken paragraph 778 about “die Entfremdung des göttlichen Wesens” in Religion refers and corresponds most directly to the “sich entfremdete Geist” of Culture’s “actual world.” It is “Faith and Pure Insight” that *simultaneously* make the opposite evaluations of the “divine *Wesen*” and of “being-for-self.”

- 32./779. The resolution is a conceptual one (and hence the purification of the moments from their subsistent aspect is what is needed). Until this happens they remain in separate realms. In the image God surrenders, dies and is reborn as the spirit of the community. But this movement is itself the reconciliation of pure thought with sensible being.

Paragraph 779 supports our double interpretation of paragraph 778. The two moments—of Man and God surrendering to one another—are logically involved in the Concept of Spirit. “The battle first has its place where both [essences] cease to be these mixtures of thought and independent thereness.” The use of the word *Kampf* should be noticed, because it reminds us both of the hopeless *Kampf* of the Unhappy Consciousness (par. 209), and of the “*Kampf* of Enlightenment with Superstition” (par. 541). It is in this second battle that the conceptual clarification takes place; and Hegel is anxious to separate the logical dialectic from the actual struggle. But the eternal perspective pushes us towards the most general view of history that we can encompass. Finite actuality and its historical process we have already dealt with. We are concerned now with the logical—or eternally necessary—aspect of what happened in the world of *Bildung*. In the theological perspective it is God, the moment that has “Being-in-itself,” who must initiate the movement towards Being-for-Self. His motion is imagined theologically as a gratuitously free act (*ein freiwilliges Thun*). God moves of His own grace to save the lost creature.

What is *imaged* here is just the arbitrariness of our human historical freedom. God moves only when his lost creatures recognize Him as essentially gracious; He must die, in order to achieve Being-for-Self. By dying God displays His true nature as Spirit; but it is in the man who died that the world's belief recognizes God. Faith *says* that God voluntarily uttered (or emptied) Himself as that man. That was the first negation for God, the otherness of *Vorstellung*—His sensible *presence*. But it was only in the Passion that this “utterance” became visible; and the Passion was the second negation, the “othering” of the first othering. It is the Risen Christ who is God; and only in that identity is God the Absolute Spirit. The *Vorstellung* gets the truth backwards, because God's Death is *necessary*. It was the man Jesus who went to death *voluntarily* for the sake of his “community”; only after his death could the Spirit come. It is in the coming of the Spirit, that the *Vorstellung* obtains its justification: Faith dies voluntarily, whereas Pure Insight goes to the guillotine under judgment. From this fully equalized death of the “moments” the “spirit of speculative Reason” is resurrected.⁴⁴

(g) *The Religion of Reason iii: The Community*

- 33./780. The Risen Lord thus becomes the spirit of a community that knows him as its spirit *now* (not just in a picture-world beyond). How is this advance beyond imaging imaged? “God takes human nature on himself.” That he always was man, and he “fell,” implies that evil is *not* alien to God. But the image cannot comprehend this, so only the later moment of redemptive identity appears; and that incarnation is particular, so it is only as *dead* that God is Spirit. That Evil is “in itself” a good potential, that “God is Nature,” that “finite nature is nothing,” these are misleading ways to express the truth. Evil is selfish, Good selfless. If we insist on this, the coincidence of the opposites can be seen, for Evil is the losing of its self, and selflessness is the gaining of self. Good and Evil are the same *and* not the same. The mistake is in thinking that “sameness” and “difference” are stable essences. Each turns into its opposite. This is the truth about “God and Nature” (especially *human* nature). Spirit is this dialectic. This is what the imagining consciousness finally realizes.

Hegel is now ready to move from the level of *Vorstellung* to that of rational “self-consciousness.” As we shall soon see, the difference between Religion and Absolute Knowing is marked by Religion's dependence on *Vorstellung*. But there is such a thing as “fully self-conscious Faith”—i.e., a religious consciousness that still uses the *Vorstellungen*, but knows what they mean, and does not count upon *any* Beyond. As we saw in the battle over the Truth of Enlightenment, however, it is very difficult for this kind of Faith to defend itself—or even to understand itself clearly—until speculative thought has arisen. So the fully “manifest Religion” goes hand in hand with “absolute knowing.”

From the first, the Risen Lord was a purely spiritual being. He existed for the community as their “Spirit.” The story of Doubting Thomas is the last of the *Vorstellungen* in which everything is backwards. Paul's encounter with Christ Risen on

the road to Damascus is an experience which we can understand quite straightforwardly as “psychological.” Paul hears the Spirit of the *community* that he is persecuting ask “Why persecutest thou *Me*?” He is the first Christian to stand explicitly in the “third relationship” of the Unhappy Consciousness, the relationship of “Faith.” Faith knows that Christ is the spirit of the community existing here and now. This knowledge is the “element of self-consciousness.”

Having reached this turning point, Hegel reviews our interpretation of the Incarnation doctrine. He only tells us what we have said already. First, God became man. This means that human nature is implicitly divine (or absolute); and the dogma that the Logos incarnated itself in the world from the beginning expresses that. This world, with all its evils, is not in itself estranged (*ein Fremdes*) from the divine essence. This is where Hegel’s theology becomes unorthodox. We can see very clearly that he is *interpreting* the religious tradition according to his rational concept of Self-Consciousness. Certainly he is not following the tradition as authoritative, and still less is he apologizing for it. “Evil,” he argues, does not come about through any “fall” from an original perfection. It is a necessary moment in the self-actualization of God as Spirit.

This truth is recognized by Faith in its *Vorstellung* of “the Word made flesh.” “But that comes later,” says Hegel. In the orthodox view, evil was no part of God’s creative work. He only had to take the burden of it upon Himself, because of Man’s fall from his God-given shape. But, like the *singularity* of the Divine Man who intervenes at the later time, this cannot be accepted in logic. The *Vorstellung* of the Incarnation itself is “*immediate*, and therefore not spiritual” as long as we think that what it means was fulfilled in the actual life of Jesus.

The speculative truth portrayed in the symbol of the “Word made flesh” as this historic man Jesus, is the logical reconciliation of God with Evil; and Hegel is anxious that we should not take this in a Neoplatonic sense. “Evil” is not simply “non-being”; it is not simply the absence of the Good, but the active negative of the Good—the actual negativity that is revealed in all action as self-assertion. The freedom of the Self is the Good; but it is just as necessarily and emphatically Evil—and the two propositions are not saying the same thing. It is only *self-knowledge* (as the *knowledge* of Good and Evil) that is identically Good.

The Enlightenment drives this lesson home. If we identify God with “Nature” (like Spinoza) and insist that “man is naturally good” (the faith of virtually all of the Enlighteners before Kant) we can only create Hell on Earth. We must cling firmly to the contradiction that self-consciousness is *both* Evil and Good. This is where the dialectic starts, from which only the philosophical concept of Spirit can rescue us. The “distinctions” needed are easy to make in principle. But (as we have seen, and as history shows) putting them together into a speculative concept is not so easy. We have to learn to think *conceptually* (or without *Vorstellungen*).⁴⁵

The Spinozist identity of God and Nature had been revived by Schelling (especially in the *Bruno*); and the neo-Platonic doctrine of Evil is also his. But it is only in the attack on the metaphor of the “fall,” that Hegel’s critique strikes at Schelling directly.⁴⁶

- 34./781. So finally, Spirit is realized in the element of self-consciousness. The divine Man is the shared self-consciousness of his community. Now it is the turn of the finite self to raise itself into this spiritual community.

The review of the Incarnation doctrine in paragraph 780 was occasioned by the transition to the third moment: Absolute Spirit proper, or the religious Self-Consciousness of the rational community (cf. par. 671). The community now “brings forth” what is only *imaged* in the theological presentation as self-conscious experience. The “fallen” or “evil” Self-Consciousness redeems *itself*—or as Hegel says “it has to raise itself in and for itself to Spirit.” This is not so unorthodox as it sounds, for we know from our previous encounter with this moment (at the end of chapter VI) that the self of Conscience cannot save itself “by works,” but only by confessing its own “evil” character. In the reconciliation of the community, it is the spirit of forgiveness, the mutual forgiveness of the agent and the judging consciousness, that saves both of them. This is the actually present spirit of the Risen Christ. The transcending of the whole standpoint of “morality” is by an act of pardon (or “grace”), which is legitimated by the fact that it is mutual. It is seen to be necessary on both sides.

There is one respect in which the orthodoxy of this “transcendental suspension of the moral” is ambiguous. The self-consciously saved (or Hegelian) Christian is not a “Christian” at all (in the *particular* sense), any more than Jesus himself was. For certainly the one-sidedness of adhering to another religious tradition must be “forgiven” by anyone who is as self-consciously human as the slave in Terence. Jesus proclaimed to adherents of all the ethical traditions in his world that “their sins were forgiven.” Hegel’s self-conscious “Christian” must offer forgiveness to non-Christians (just as Dante evidently hoped God would forgive the virtuous pagans); but she must also accept forgiveness for being a “Christian” as well. For what is “manifest” in the Manifest Religion is that God is revealed in all of the “Shapes” of Religion.⁴⁷

In my analysis of paragraph 780 I interpreted the “particular” (*besondere*) character of the “*incarnate* shape” of God in terms of the only “particularity” that is visible in the “immediate shape.” It is the Shape of the *dead* Savior that is “particular not yet universal.” But now that the Shape has *become* universal, we can see a deeper sense in which it was “particular” before. In becoming “universal” the Incarnation becomes universally *singular*; before that happened Christianity was a “particular” faith. The Manifest Religion is not a “particular” faith; if it is a “faith” at all, it is one that recognizes itself wherever the forgiving of finitude can be found. Lessing’s Nathan is a model of it—and of course, he is *not* a Christian. Salvation “in the *name* of Jesus” (or any *other* “name”) belongs to the phase of “religious perception.”⁴⁸

- 35./782. Man begins as “the natural spirit” and he must fall from this innocence and know it as evil. This is how imagination takes the world. But for self-conscious spirit the wickedness of the world is a sublated moment; in the unity of the moments for self-consciousness each gets the opposite meaning to what it had in the image. Every moment becomes dialectical (as it has done for us already).

The self has to break with Nature, and become the Unhappy Consciousness. We should interpret this now as the betrayal and loss of the *Greek* Garden of Eden, the Paradise of True Spirit. The Self-Consciousness of Comedy is evil *an sich*; it must “convince itself of this” and repent of it. Then its path of salvation can be presented to it as a *Vorstellung*.

But all of this has happened and is completed. Now that the Spirit has arrived at the point of *understanding* itself completely, the whole process must be inverted in a second negation which preserves it all at the higher level of self-conscious rationality. We are moving now from Faith to Knowledge; the mysterious fact of God’s forgiveness of human finitude—what Hegel calls the “*daseiende* reconciliation of the absolute essence”—must now be conceptually comprehended.

This involves the comprehensive inversion of the plain meaning of every moment in the *Vorstellung*. In other words, the *Vorstellung* does not lose its primitive significance, but it gains this opposite significance in addition. Through this completion it becomes “spiritual.” We have already seen how this is implicitly the case; and I have tried to bring it out clearly at every stage. But now it is to become the experience of the religious consciousness that we are observing.

Kojève marks paragraph paragraph 786 in his analysis (which is a very good one, and full of insights) as “The ‘truth’ of Christianity: Christian theology is Hegelian anthropology”; and he calls paragraph 787 “Transition to atheist wisdom.”⁴⁹ It is easy to see that at the level of *names* we cannot quarrel with the label given to paragraph 786. The interpretation of “Christian theology” does turn it into “Hegelian anthropology.” But here in paragraph 782 we can see why the immediately following interpretation of “Hegelian anthropology” as “atheist wisdom” is invalid. Hegel insists here that the humanist interpretation is *added* to the orthodox theological one. The meaning of “faith” is comprehensively inverted—that is why the characterization “anthropology” is justified. But the conceptual ground of faith—its claim to be a kind of “knowledge”—is preserved. What Hegel asserts is that the “Father” of whom the Johannine Jesus spoke, is identical with the human community from Altamira to Nagasaki (and however long it may last after that). That this community—with the Earth on which it lives as its “body”—should be a *real* “universal self” makes no sense to Kojève. His “anthropology” has a Kantian “form” as its conceptual ground. Human “self-cognition in religion” is the same “futile passion” for Kojève that it is for Sartre. Futile effort is certainly part of human experience; and it is “futile” in my opinion to think that one can move an enlightened sceptic from his scepticism. But it is legitimate to say that the “Truth of Enlightenment” is not the Truth either of the Manifest Religion or of “absolute knowing.”⁵⁰

- 36./783. Thus what appears in the image, as our fallen condition, is now the freedom that is the *an sich* in being. This is the first moment of reconciliation. I can now “die to sin” without actually dying. This is a *different kind* of “withdrawal into self.” But this “withdrawal” is the same motion as that of natural selfishness. So this simple self-concept still has to go through a cycle of othering and return.

The consciousness of original sin as ineradicable—which tormented the Unhappy Consciousness and could only be overcome through reliance on the “absolution” declared by another self—can now be recognized to be the necessary condition of that “*knowledge* of Good and Evil” which comprehends why we cannot have or achieve any good, without the presence of evil as its dark side. This speculative comprehension is the foundation of what will eventually become our ability to forgive each other and ourselves. But that is still well beyond this stage.

The first step on that road is to see that asserting oneself against “life” is evil; but knowing that the world is “fallen,” and withdrawing into oneself in order to seek God is the first step on the path of salvation. The world is now recognized as evil (and the Christian consciousness is, in its first position, the *judging* consciousness). The world from which the Christian consciousness withdraws is the “Earthly City,” or the sphere of the universally competitive pursuit of happiness. This natural world has already withdrawn into selfishness, and so it deserves condemnation as evil. But (as we know already from the analysis of Conscience) the two withdrawals are exactly equal. So this first movement is the *immediate* one, the appearance of the Concept as simple (or direct) contradiction. The Christian community sets God (and itself) up as the *Absolute Judge*. This is the social position of the Church in the universal constitution of the Unhappy Consciousness as *Bildung*.

- 37./784. To differentiate the “withdrawals” the mediating of the image is necessary. In the image the withdrawal from nature as my false self is a higher state represented by the Savior. *God* saved me by dying for me. Self-conscious spirit must grasp the Resurrection as a communal experience here and now. God’s death and resurrection as a single man becomes the universal experience of every day in all of us.

The contradiction is mediated, by transferring the function of judgment to the Christ of the religious *Vorstellung*. It is he who has the knowledge of Nature as the untrue mode of being of the Spirit, *his* consciousness is “the universality of the self that has come to be within itself.” For this is “*an sich* . . . the reconciliation of the Spirit with itself”; and it is the Risen Lord who is the image of what Spirit is *an sich*. God reconciled Himself with the world in Christ. Salvation is not something logical, but something that God *did*, something that happened.

This *Vorstellung* is now inwardized, but not yet rationalized. The religious consciousness does not realize that it is facing a necessary truth about human consciousness generally; but it does know that the Resurrection is a universal, or communal experience. The Savior is resurrected in his community here and now. It is not a historic event of far away and long ago.

Thus in the “divine Man” his death is identical with his Resurrection as (and in) the Spirit.⁵¹ Death is no longer just the end of life (“abstract negativity”) and the return of the body to the organic universality of the Earth. It is that, but it is now the moment of spiritual Resurrection as well. Christ is crucified afresh every day in my sins, failures, and imperfections, but he is reborn every day in the universal forgiving consciousness of the community.

38./785. Thus there are not *two species* of mankind (“embodied” and “risen”), but a dying and a rising again for me now. My specificity is dissolved in my knowing that the Last Judgment is superseded in actual experience. The Good has become Subject; Christ rises in me as my actual forgiving Judge. This means that the eternal God has become self-conscious in me. So the death and resurrection of Jesus coincides with the *death of God*. Jesus (as a man) was just the one-sided insistence that only “the Kingdom of God” matters; only the Risen Lord is really equal to the Father. But now both are dead together, and the Unhappy Consciousness is justified in claiming that all is darkness. This night is the breath of Pentecost (not historically but now).

As the mediator of the community, the Risen Christ is the *particular* moment between the “singularity” of the repentant sinner and the “universality” of the Father. The “universality” of the Father is God as our Judge. The Church assumed the function of judgment “on earth” because Jesus assigned it to Peter (Matthew 16:19). Through the moment of Unhappy Consciousness which makes each of us a singular soul in the Beyond, the *finality* of any earthly judgment is avoided. But the “Shaped Unchangeable” received this function from the Father and particularized it into the “judgment of the quick” and the “judgment of the dead.” Now, through the speculative understanding of death and resurrection, this “particularity” is sublated in a “singularity” that is “universal.” The meaning of it is transformed by the internalization of Christ in the worshipper (as Augustine’s Inner Judge, or Inner Teacher). Every one of us “dies” as sinful, and is “quickened” by forgiveness. The shape of the *Vorstellung* (in which “Earth” and “Heaven” are divided) is sublated. The “particularity” of the Judge—who being a man like ourselves is a “mediator”—“perishes in his knowing universality, i.e., in his knowing, which is the essence that reconciles itself with itself.” The Mediator is himself perfectly good; but this “perfection” consists (as it logically must) in his “forgiving evil.” This is logically necessary because he comprehends the evil involved in the judging posture. One cannot *be* “good” if one judges. Thus the historic Jesus enjoined upon us: “Judge not, that ye be not judged” (Matthew 7:1).

The absolution of the Unhappy Consciousness depended upon an authoritative assurance. But now, when the Savior who forgave those who crucified him is internalized, the rationality of the “will of God” is fully appreciated.⁵² It is *me* who see that the repentant sinner must be forgiven, because judgment is as much a sin as the act repented for. Whether as agent or as judge, the self is “particular.” The *wholeness* of self-consciousness, the union or reconciliation of self and world, is found only in the attitude of forgiveness. Jesus himself, in life, was obliged continually both to act and to judge. When, in his death, he forgave even those who could not be repentant, because they had no consciousness of doing wrong, he finally achieved and expressed the standpoint of “absolute knowing,” the complete supersession of the moral valet.

Of course, we are not speaking here of what is “illegal” or “unethical.” Every healthy community deals with “crimes” and “transgressions of the code” in accordance with the law, or the code, itself. Moral considerations (of “intention” and so on) enter into those judgments only in an ancillary way. The social imperative of

Objective Spirit is that “Justice must be done (and must be seen to be done).” Our concern now is only with the judgment that a rational Conscience has to pass upon itself. In this connection, we have already seen how (and why) the standpoint of Religion transcends that of Morality; morality is sublated because moral disagreement is recognized as “the will of God.” In the world of free self-consciousness, every act must be the subject of opposite assessments as “selfish” and “unselfish.” Every act is (and must be) both. The standpoint of “absolute knowing” is that which comprehends why the act had to be the way it was, instead of judging it as right or wrong, and the agent as saved or damned. The religious community knows that even those who do not repent must be loved and understood; and that only through the recognition of the loving effort of comprehension on the side of the observer, can the agent come to appreciate (perhaps) what there is to repent for. This is the truth misrepresented by the judgment of William James, that the Hegelian Absolute is a “moral holiday.”⁵³

The *actual* death of Jesus united him with the Father in pure thought. It was the option for the Beyond, the option for Faith’s realm of “pure consciousness” in preference to the cultural realm of “actuality.” But the Resurrection, Ascension and Descent of the Spirit inverts this option into a comprehensive identity of Heaven with Earth, God with Man. God, as pure Thought, is “dead”; it is in the Descent of the Spirit that He dies properly. But all of the spiritual (Heavenly) half of the circle is now concretely contained in the Crucifixion. The Descent into Hell, the Resurrection, the Ascension, and Pentecost are *Vorstellungen* of the great conceptual change in the significance of death. The Crucifixion is the real experience in which God and Man both die (in their separateness) in order to become one, not merely in thought (the Ascended Lord sitting at the right hand of God in Heaven) but in actuality (at the Pentecost of this day’s forgiveness). Earlier, Hegel identified the Crucifixion with the Resurrection (par. 779 last sentence). Now, when he is insisting most emphatically that the Crucifixion expresses the “truth” of Unhappy Consciousness (that *Gott selbst gestorben ist*),⁵⁴ he identifies the *knowledge of God’s having died* with the “*Begeisterung* whereby Substance has become Subject . . . *actual* and simple and universal Self-Consciousness.” In other words, he identifies it with his own interpretation of the Descent of the Spirit. “We” (who do, after all, want to be cultural historians) have a better theoretical grasp of how “substance” is sublated here than the (wo)man in the street. But the experience of the “sublation”—the experience of being at peace with oneself, because one is at peace with the world, is not primarily a theoretical one at all. It can happen to anyone (in the shape of a “feeling” that has no awareness of being thoughtfully mediated). Our way of experiencing it is only important because the “objectivity” of all “Science” is founded upon it.

39./786. Thus Spirit is *self-knowing* absolute Spirit. It unites the three moments; it is the mover, the movement, and the medium (substance) in which the moving happens. We have come back to the concept of absolute Spirit that we had reached when we embarked on this chapter. For the act is a judgment that forgives and so abandons its primitive “unchangeableness” to become the *Yes* of freedom.

The community for which the whole cycle from Crucifixion to Pentecost is an inner experience of everyday is “the Spirit knowing itself.” Its object, the remembered Savior, is the “true absolute *content*.” But this *Vorstellung* is only the image of the community’s own actual experience. The community “runs through the three elements of its nature.” These elements are the (1) pure thought of God’s judgment, (2) the *Vorstellung* of the Mediator, and (3) self-conscious forgiveness. In the movement, Spirit is *what moves itself*, throughout the process. As it moves through the three elements, it becomes three moments. In the element of pure thought, it appears as the self-moving *natural self*, and hence as “condemned” or evil; in the *Vorstellung* it appears as the dependent self which is moved towards the saving image; and in self-consciousness it is the Spirit that moves itself rationally. From being “nothing,” it becomes “I who am saved by faith,” and finally “I that is We, and We that is I.”

The motion goes through the *Substance*. This “Substance” is both the thought-substance of God, and the actual substance of the world: the “estrangement” between them (which is absolute for the Unhappy Consciousness) is gradually overcome (and the progressive disappearance of the Unhappy Consciousness is the index of this). The “element” of *Vorstellung* is where these “estranged substances” (thought and being, God and the World) stand side by side—and hence this “element” of objectivity (or Substance) is where the motion really happens. The motion is the same motion of “Conscience, the Beautiful Soul, Evil and Forgiveness” that we have already observed in the sphere of actuality. We have observed it now in the sphere of “pure thought”—or as the motion of God the Father, through Incarnation and Death as the Son, to Resurrection, Ascension, and Descent as the Spirit. The motion in this absolute perspective is God’s “forgiveness” of evil, comprehended as His necessary reconciliation with finitude, His manifestation of Himself in His truest and highest shape (as Spirit), through the acceptance of finitude (and of the resultant “evil” of selfishness). But Hegel does not speak of our “forgiving” God, or of God’s “forgiving” Himself,⁵⁵ because he wants to use “forgiveness” only as a practical relation between the finite selves. “God” is simply the “law of righteousness” that becomes the “reconciling Yes” and does away with the “particularity” (or onesidedness) of the “extremes” of judgment. This motion establishes the wholeness of integral Self-Consciousness as the *Sache selbst* (the subject who is also Substance). We can quite properly call this the translation of theology into anthropology (as Kojève does). But we must not lose sight of the fact that the embodied “subject”—who is still just as mortal as the Comic Consciousness—comprehends “everything human” spread out in the temporal “substantiality of thought” and the spatial “substantiality of being.”

40./787. But the content still exists as images for the community of forgiveness. It has transcended the natural meaning of the images but it still uses them. For this reason the community of self-consciousness is not *presently* self-conscious. God becomes self-consciousness in it, but it does not recognize what that means: that its own self-consciousness is *identical* with the substance. It takes the descent of the spirit as a work of grace from above. It does not grasp that God has now *risen again* as self-consciousness

through its own devotion. It thinks that the substance of things moves by itself, and does not think of this movement as something that the self accomplishes. So although it experiences union it still looks to fulfilment in the future of this world. Jesus had a mother and no present father. The religious community has a father (its own activity) but no present mother (only a love that remains inward). Its world is disrupted into what is "now" and what is "to come." The immediate sense of God's presence has still to spell itself out in a reconciliation of the world with itself.

The "Self-Consciousness" that the community has achieved is still a *Vorstellung*. The community "knows itself in God" without comprehending what that means. It does not yet have the concept of self-consciousness, the concept which it is (or incarnates). It has not objectified the concept for itself as a *Concept*, but only as a *Vorstellung*, an instantiated concept in which the "movement" is grasped as transcendence. The "other" posited by this *Vorstellung* is completely internalized in consciousness; it is a concrete, not an abstract, "beyond." But it is still *other*.

"Now I live," said Paul, "*yet not I*, but Christ liveth in me" (Galatians 2:20). "It is not by dialectic," added Ambrose, "that God has chosen to save his people."⁵⁶ But, if Hegel is right, God has no choice in the matter. For it is not God alone—as the transcendent "substance" in which we live and move and "have our being"—who can save us; and it is "by dialectic" that the people does, and must, save itself in God. The last moment of "Faith" to be overcome is that threshold of thought at which the Unhappy Consciousness knelt in silence. From first to last, Religion is *devotion*, *Andenken*. It is intuitively directed towards an object of pure thought, from the Rising Sun to the Risen Christ; but it obstinately refuses to think, except in the external mode of observation. The community of forgiveness is prepared to contradict Ambrose directly, and to say that God has indeed chosen to save us by dialectic. One could even paraphrase what Hegel says about "this depth of the pure Self" being "the compelling violence [*Gewalt*] by which the *abstract essence* is dragged down out of its abstraction, and raised up to the Self by the might of this pure devotion," by saying that "God saves Himself in His people by their dialectic." But the religious community will not readily say that; and in everything we say about God, we ought to remember His logical status as a pure thought ("the Unchangeable"). What is true, then, is that God is eternally saved in His people by their mutual comprehension.

This *eternal* mode of speech about God preserves the logical character of His self-emptying into selfhood as an *Ansich*, or as something which no action of the people can affect. It is the recognition that this *Ansich* is the In-itself of the community's *own* pure thinking or logic that is the one step that we have still to make. At present, the eternity of philosophical truth is something that religious devotion recognizes, but cannot comprehend as a moment of its own essential changeableness. The sublation of its changeableness in the Unchangeable has to be put off into the future. It is externally tacked on to the reconciliation with God in the community. It is then thought of as the final goal, a sort of "millennium" which I experience now, but which is still "to come" in the world. The "Sunday consciousness" of the community is still alienated from its "weekday consciousness."

Hegel expresses this circular return to the Moral World-View, through a curious metaphorical inversion of the Virgin Birth story. The history of the Christian revelation moves from world-belief in a God-Man who has an actual mother but no actual father, to a community that has an actual father in the Spirit (the Risen Christ present in “its *own doing and knowing*”) but no actual mother. The Church Triumphant is still an object of *love* and *hope*, not of actual experience. The Church is not reconciled with its present actual world (as the Art-Religion was, however tragically).

It seems clear to me that in this perspective, Religion is a permanent “shape” of Spirit. There is an important sense in which this *Entzweiung* of consciousness, this *Gebrochenheit* of actuality, *cannot* be abolished. The Christian definition of God as “love” expresses the rational attitude toward the openness of the future.⁵⁷ Our active orientation to the future cannot but be critical of the present (even if we are only consciously critical of those who want to change the way the world is now). So we are bound to look to the future with a faith and hope that should always be guided by charity toward the faith and hope of others. As the universal community of this spirit of charity, the Church must always remain sundered from any actual community. The actual structure of society is always, necessarily, a particular (and hence a changeable) “State.” A final “Heaven on Earth” in which “the State withers away” is just as much an illogical phantasm as the Heaven of faith; and now that we have reached the final shape of the “estrangement” of thought from actuality we can see that the Marxist “gospel” is one of the logically necessary *shapes* of “the manifest Religion.”⁵⁸ “Marxism” cannot be “Science,” precisely because of its orientation towards a rational ideal that is not already *actual*.

Hegel’s final reconciliation of the religious spirit with actuality can do no more than banish *both* of these phantasms from our minds. In this respect his philosophical community, the community of Absolute Knowledge, is a universal resurrection of the Greek *tragic* consciousness. It is no accident that his speculative theology concentrates on the unorthodox thesis that evil is to be “grasped in the divine Essence” (par. 777); and that it must be comprehended as *evil*, not harmonized with the goodness of God by any conceptual sleight of hand (par. 780). We must be reconciled with its absolute necessity, and consequently with its eternal presence. The symbol of the Crucifixion (universalized as “the death of God”) is indeed *crucial* to the Manifest Religion. The Science of Experience inverts it into the moment of Resurrection; and science generally teaches us to distinguish *necessities* from removable “evils.” But “removable evil” is itself a *necessity*, because the removal of one evil creates another. Our negative practical attitude to “evil as evil” is logically determined; so all that can be debated is *how* it should be overcome where it is perceived; and it is a logical necessity that we shall always disagree about that.⁵⁹ The religious doctrine of comprehension is the foundation of a new perspective and a new strategy; but it does not change either the practical duty or the inevitable disagreement about values and priorities. So the Church will always remain a critical conscience of actual society—with all of the anarchy of Conscience sublated in the Spirit of charity.

Let us close by reviewing the phases of the Manifest Religion in their scientific aspect. Manifest Religion is the “Religion of Reason.” Absolute Knowing will produce only the “concept” of Absolute Spirit, in which this objective (social) shape of Reason is self-consciously integrated with the subjective shape of Reason. This provides the *closure* of the “Science of experience” upon itself. The full development of the pure concept of Absolute Knowing is the proper project of Philosophic Science as a “system.”

The first phase of Rationally Manifest Religion is that of the Unhappy Consciousness raised into universal awareness of the Substance. Here the finite Spirit is a Reason that *observes* the Absolute Spirit in Pure Thought. God in Heaven—the Unchangeable Objectivity which the singular Unhappy Consciousness cannot reach—unfolds logically as “the Trinity.” This determines the other moments as follows:

Consciousness as Understanding (a):	The Inner Concept of Force as the necessary mutual <i>solicitation</i> of two complementary forces.
Self-Consciousness as Unhappy:	First Relation: God as Judge (complemented now by the Divine Emperor and Gnostic Hopes).
<i>Observing Reason:</i>	(a) The Universal Individual (and its Life) (b) Phrenology (singular Self-discovery as a <i>Ding</i>) ⁶⁰ (c) The universal <i>Volk</i> of God (Dante’s <i>Comedy</i>)
Spirit in Self-Estrangement:	The Trinitarian Faith ⁶¹

The second phase is the world of the estranged *Vorstellung* in motion. Here everything is dominated by the God-Man’s story:

Consciousness as Understanding (b):	The world of Appearance, Law, and Explanation
Self-Consciousness as Unhappy:	Second Relation: Dependence and Trust
	(a) Devotion in Church (Jesus in Solitude) (b) Desire and Labor in the world (Jesus as Teacher and Example) (c) Contrition and Absolution (the Crucifixion)
<i>Active Reason:</i>	(a) Pleasure surrenders to Necessity (the Crucifixion) (b) The Heart triumphs over Self-Conceit (the Resurrection) (c) Virtue returns to the World (Pentecost)
Spirit as Culture:	(a) Noble Service and Sacrifice

- (b) The “Truth of Enlightenment”
- (c) Absolute Freedom and Terror

In the final stage each moment contains its opposite. Spirit reverses the motion of Reason and moves back from the Crucifixion to Pentecost. This circular aspect of things is the emergence of Absolute Knowing. In this phase (Self-Conscious Reason) we find:

Conscious Under- standing (c):	The Inverted World (cf. par. 158)
Self-Consciousness as Unhappy: Third Relation:	Salvation ⁶²
<i>Achieved Individual Reason:</i>	(a) The Thing Itself (the Community of Humanity) (b) The Law of Loving God and ones’s Neighbor (c) The Forgiving of Trespasses (as the Test of Reason)
Spirit	(a) The Judgment of Conscience (Crucifixion) (b) The Beautiful Soul in its Universal Community (Resurrection) (c) Evil and Forgiveness as actual experience (Pentecost)

The tragic return of the Crucifixion at the level of Spirit (“the harsh truth that God is dead”) represents the fact that the healthy Conscience directs its Judgment upon itself; and the fact that self-forgiveness must never become too easy. What is involved is a forgetting of the past in our active concern with the future. This is the aspect under which we can see why Religion can never completely disappear into Absolute Knowing.⁶³ Religion *can* disappear as the *particular* cult of the first phase, and under that aspect it is bound to multiply. Its disappearance into “Scientific atheism” is simply one shape of this logically necessary multiplication.⁶⁴

Notes

1. F. Guibal (1975) provides useful analyses and diagrams for Hegel’s discussion of “Manifest Religion.” Hegel’s use of the concept of “revelation” in the *Philosophy of History* is examined by John Walker (1989). This provides valuable insights into the brief logical analysis given here.

2. This is the reason why Hegel maintains that philosophy begins in Greece. Philosophy is not reflection *about* the Absolute, but “absolute” (i.e. free) self-consciousness. Cf. *Einleitung* (Hoffmeister), 225–227; *Geschichte der Philosophie* (Glockner) I, 183–188.

3. The Roman Peace, based on the “artful system” of Augustus, was regarded by Gibbon as the *happiest* period in human history (*Decline and Fall*, London, Everyman, I, 78). Hegel

accepts Gibbon's view, and simply applies his own moral standard to it when he calls it "the boredom of the world" (Rosenkranz, 136; Harris and Knox, 181).

4. The implication is that "in itself" (and hence "for us") the Light Essence *cannot be* "the Absolute Subject." The worshippers take it to be the "absolute Self"; but *we* can see that it is *not* a proper self (because it has no "other" in which it can recognize itself). The "absolute Self" of the Unhappy Consciousness *is* the Light Essence that has returned to itself in thought (Yahweh). The moving relation of this absolute Substance to the finite self-consciousness *makes* it into the Absolute Subject.

5. Hegel's text is ungrammatical, and the emendation which the Critical editors have accepted from Moldenhauer and Michel renders the sense correctly. But since Hegel does not give us the "proposition" of "the first substantiality" at all, it is better to leave the text alone. The "first substantiality" cannot utter its own "proposition"—that is why Hegel writes in such an irregular form.

The evolution of the speculative proposition—"Absolute Essence is the Self (Natural Religion), the Self is the absolute Essence (Art-Religion), and the Absolute Essence is [spiritually] the Self (Manifest Religion)"—is examined in detail by G. Wohlfahrt (1981). I hope it will be found that my briefer discussion has added some necessary refinements. (The "Christian" prejudice in Wohlfahrt's view is too strong. *Every* kind of religious experience requires "speculative propositions.")

6. This mode of expression is intended to cover such cases as the devotion of Hippolytus to Artemis, the labors of Heracles, and, of course, the *Bacchae*.

7. All of these data I owe to the marvellous book by Robin Lane-Fox, *Pagans and Christians* (New York, Knopf, 1987). Judicious users of his index can quickly find many more like them.

8. In the culture of 1800 this situation has returned again at a much deeper level. It is one major function of the *Phenomenology* to resolve it, by putting all of the "shapes of God" into a "pantheon" of quite a new kind in which Beauty and the Understanding can finally be reconciled.

R. K. Williamson has rightly grasped that "the dialectically later is not necessarily spiritually superior" (1984, 347, n. 93) in his discussion of Fackenheim (1970, 157). (Fackenheim himself is criticizing a mistaken interpretation; but his own view of how Hegel regarded dialectical development is unclear.)

9. Most of the "persecutions" were locally inspired; and the local populations would naturally be mainly concerned about their own cults. The failure of Christians to make the required gestures of veneration for the Emperor (or his ancestors) served as an argument by which the Roman authorities could be forced to act.

10. Compare Cleanthes' Hymn to Zeus (von Arnim, *S.V.F.* I, 537; M. Hadas (ed.), *Essential Works of Stoicism*, New York, Bantam, 1961, 51–52) with the inscription at Oenoanda about "All-seeing Aether" (Lane-Fox, 169). (The fact that the *Epicurean* philosophy was certainly influential in Oenoanda should *help*, rather than hinder, our appreciation of what Hegel calls "Stoicism." The Epicurean, Diogenes of Oenoanda, is a perfect paradigm of "freedom of thought.")

11. Acts, 14, 8–18. Paul is taken for Hermes, because Zeus is expected to speak through his usual messenger and herald. Compare also Acts 28:2–6.

12. The phrase comes from Luther (see *Werke*, Kritische Gesamtausgabe, Band 50, 589). But Hegel was probably echoing a hymn of the seventeenth century—compare *Vorlesungen* V, 358; Hodgson, III, 125.

13. Plutarch, *Moralia* 419B.

14. Carducci, *Rime nuove* 14: Muor Giove, e l'inno del poeta resta"; Gentile, *Filosofia dell'arte*, 2nd ed., Florence, 1944, 292–293 (Gullace, 263–264).

15. For a Christian theological interpretation of the “implicit father and real mother” see H. Küng (1987, 208–209).

16. When we refer the “resurrection of the body” to the supersensible world of Faith’s “pure thinking,” it becomes (as pagan critics always recognized) the most intolerable of all the absurdities in the Christian Creed.

17. Many interpretations of the *Phenomenology* seem to me to treat it like that. The one that lies closest to hand for Anglophone readers is the “Analysis” by J. N. Findlay in Miller’s translation. I am myself quite prepared to subscribe to Michael Rosen’s condemnation of all such “Neoplatonic fantasies” whatever their provenance may be.

18. This moment in the evolution of religious truth has come round again in Hegel’s contemporary world—see the Preface (par. 10). It is a sign that the world is ready for the transition to “Science.” Thus H.-G. Gadamer was right to call Hegel’s “Absolute Knowing” a “Gnostic self-redemption of finitude.” (Hegel depended mainly on August Neander for his knowledge of Gnosticism. For an estimate of its limits, and of Hegel’s sympathies and insights, see C. O’Regan (1994, Subject Index).

19. According to P. C. Hodgson and J. M. Stewart (Jaeschke, 1990, 318, n. 57), Hegel’s “es ist *wirklich an dem*” simply means “it is *actually the case*” (not, as Miller has it: “is actual in the believer”). This is important *historically* because some members of Hegel’s school seem to have believed that the historic actuality of Jesus was here deduced. What the actuality of “this self-consciousness” *must logically* mean is stated in my commentary. Anyone who ascribes to Hegel the view that a historical *event* can be deduced “logically” is crediting him with an appalling error about his own logic. The way that he makes this “actuality” depend upon the *appearance of a universal belief*, shows that he made no such mistake. But even if one obstinately maintains that Hegel *did* hold this mistaken view of what the “universal belief” necessitates, the supposed deduction remains a logical mistake and nothing else. (R. Gascoigne [1985] deals mainly with Hegel’s Berlin philosophy of religion. But in his first chapter he integrates the contributions of the *Phenomenology* fairly adequately. He takes the historicity of Jesus rather more literally than is necessary [1985, 25]. D. P. Jamros [1994, 194–195] understands the historic Incarnation much better.)

In fact, what is *observed* (not “deduced”) here is the *experience* of “Christ living in me.” So Miller’s mistake makes no difference to the only logically defensible interpretation of the argument. I cannot stand in the “third relation” to the Unchangeable without admitting as a necessary truth that an earlier *world* stood in the “second relation.” But once I am in the “third relation” I can believe whatever seems reasonable about the factual *correctness* of the historical beliefs upon which the “second relation” depended. (That some components in the “belief of the world” are logically incomprehensible was never denied even in the “second relation” itself.)

20. J. N. Findlay (1958, 139) got the point of this sentence. *Pace* H. Küng (1987, 227) “faith in Christ” is *not* “presupposed in his [Hegel’s] way of doing philosophy.” Jewish, Moslem, Indian and Japanese students (or enlightened modern agnostics) do not need to become Christians in order to comprehend the concept of Absolute Knowing with full agreement. (All of them must, of course, appreciate what the Christian experience contributed to make Hegel’s consciousness of Absolute Spirit possible.)

21. It is in the Mass that this “spiritual sense-certainty” is *vorgestellt*. But, philosophically, we should remember at this point that Jesus himself, when he was among the children, said “Whoso shall receive one such in my name, receiveth me” (Matthew 18:5). Also the voice that spoke to Paul identified the persecution of the physically living community with the persecution of its dead self (Acts 9:4–5; 22:7–8; 26:14–15); and the final meaning of the moment of sense-certainty is given by I John 4:20: “. . . he that loveth not his brother whom he hath seen, how can he love God whom he hath not seen?”

This seems to be the appropriate point at which to remark that E. Brito’s attempt (1979, 19–49) to distinguish between the “subjective” Christology of the *Phenomenology* and the “historical” (or “objective”) Christology of the Berlin Lectures is patently invalid. I would not wish to take a position here about the relation between religion in the *Phenomenology* and religion in the *Encyclopedia*. But I will say that insofar as the Lectures are “historical” they are *ipso facto* “phenomenological.”

22. The doctrine of the Incarnation in Manifest Religion is not “orthodox” even in the rather liberal sense in which the Christology of writers like James Yerkes (1982) or Hans Küng (1970; 1987) might be called orthodox. (The “Catholic” orthodoxy of the latter has, of course, been called in question.) Hegel’s doctrine holds good *philosophically*, without any act of “Faith” being required. Thus the *manifest* (or *absolute*) religion has only an “invisible” Church which comprehends all the visible churches. Q. Lauer—who certainly agrees that the Christology of Yerkes is that of Hegel—has correctly said (1976, 254) “God and man are *not* one and the same *being*; they *are* one and the same *process*.” In philosophical terms, no she is God qua finitely embodied from time_i to time_{i+x}; but every she who grasps what her proper *humanity* consists in, is *as much* God as she is *human*. (Hegel’s view of the movement of salvation was probably inspired—or at least confirmed—by his reading of Eckhart. Compare M. Henry [1973, 333–334, 428]; also C. O’Regan [1994, 194–195].)

Outside of this absolute *identity* there are only “beings” that are *less than* “God”—though they may be very *real* and *awful*. For example, there are the “order of Nature,” and the Lawgiver who authorized the *fatwa* against Salman Rushdie.

23. I have deliberately substituted the formula from the Nicene Creed for Hegel’s *Mosaic* formula “Creator of Heaven and Earth,” because I think it helps to make a bridge between our *conceptual* activity and the abstract “thinking” of dogmatic theology.

24. See the stories told by Heinrich Heine in Nicolin reports 362–364.

25. Synesius of Cyrene wrote to a correspondent in about 408 A.D. that some country folk believed King Agamemnon was still in power, and that he had a friend and minister called Odysseus, “a bold man, but clever at finding ways out of difficulties . . . Indeed, they laugh when they speak of him, believing that he blinded the Cyclops only last year” (Epistle 148; I cite the story from R. Lane-Fox [1987, 48–49]); one cannot help suspecting that some educated person—Synesius himself?—has had his little joke with them.

26. The *abstract* possibility that Paul might be lying must be conceded, because the freedom of “thinking” requires it. *Concretely*, however, the coherence of the record of Paul’s life after his conversion raises obvious problems about what the word “lying” could mean in this hypothesis. One who advances the hypothesis would, it seems, have to be employing a concept of the “real truth of character” like the one that we find in “Phrenology.” So we need not trouble ourselves further about abstract concessions of this sort.

27. I must emphasize, again, that it does not matter in the least whether the historic man from Nazareth had this consciousness or not. This is the “shape” that is *remembered* in John’s Gospel; and a “false” memory is indistinguishable from a “true” one, once there is no longer any possibility of contradicting it.

28. The *actual* community is the community of the living; the *religious* community is the community of the living, the dead, and the yet unborn.

29. The form *Gemeine* is old. It was used by Luther both for the empirically present congregation, and for the ideal “communion of saints.” See T. Rendtorff in J. Ritter (ed.), 1974, 238, col. 2. (I am assuming that it signifies here the *withdrawn* community of would-be “beautiful souls.”)

30. Hegel speaks of “the spiritless recollection of an intended [*gemeinten*] singular shape and its time that is gone.” The word *gemeinten* indicates clearly that the historical Jesus is beyond our reach as philosophers. It does not matter to us what sensible phenomenon the *belief* of consciousness is actually pointing at. The *historical Erinnerung* involved in this “pointing” is *geistlos*. It was relevant to the Crusaders, but it is not significant for us.

31. Compare Rosenkranz, 546 (*J.P.* iii, 1979, 3, no. 4); 547 (*Clio* 12, 1983, 405–407); and Rosenkranz, 182 (Harris and Knox, 256–257).

32. There is an impressive body of scholarly discussion concerning Hegel’s interpretation of the dogma of the Trinity (most of which is not directly concerned with the *Phenomenology*). The Anglophone reader should begin with D. M. Schlitt (1984), whose work is well founded on that of J. Splett (1965) in German; and C. Bruaire (1964) and A. Chapelle (1964–1967) in French.

33. K. Barth (1959, 268) asked “Why did Hegel not become for the Protestant world something similar to what Thomas Aquinas was for Roman Catholicism?” The answer is simple: unlike Thomas he did not accept the *divine* authority of the Scriptures. He sought to transform (and in a certain sense to invert) the whole relation between Reason and Revelation, in the light of Kant’s “Copernican Revolution.”

34. *Philosophy of Religion* (ed. Jaeschke, I, 212–213; ed. Hodgson, I, 308, n. 97). This famous remark occurs only in Hotho’s transcript of the Lectures of 1824. Perhaps Hegel did not say it in his public lecture; but he must *surely* have said it to Hotho. The “necessity” of Creation troubles H. Küng (for a useful review of Küng’s attitude to Hegel see J. P. Fitzer, 1972). But this *necessity* of creation is identical with its *freedom* (cf. G. S. Hendry, 1981, 350). (W. Pannenberg complains that there is a “leap in thought” from the universal as “free power” to the universal as the “freedom of love” [1973, 174–175]. But this “leap” is only *arbitrary* if we take it to refer to a real being posited as beyond or above us. In our interpretive concept of the human experience of the world, it is only a dialectically logical development.)

35. W. Kern’s proposal (1959, 423–427) that the Hegelian dialectic of knowledge must be extended by a “dialectic of love,” seeks to mitigate the *absoluteness* of the otherness in which self-recognition takes place. But this mitigation is only *mystically* possible. We cannot escape from the *finitude* of selfhood; hence we must always recognize the *otherness* of the other-self (or of God). This is how “ontic” difference appears within the “ontological” identity of Absolute Knowing.

Our commentary has gone through Hegel’s argument backwards. We began from God’s logical need of the world in commenting on paragraph 772; and we have only spoken of the *eternity* of the Logos now. Hegel goes the opposite way. My hope is that the inversion will help to make clear what the argument is.

36. Hegel did not make the mistake of thinking that everything *in* the “resolve” was physically *perpetual*. Since God is Spirit, the resolve is “for freedom.” So although Hegel’s philosophy of organic nature is not evolutionary, it is not Aristotelian either. The evolutionary hypothesis is quite consistent with it.

37. When we extend our view beyond the natural order, to “Heaven and Earth, and all things visible and invisible,” this reading becomes ever more convincing, because, upon our interpretation of it, “creation from nothing” begins to make sense for the very first time.

38. See the Dissertation of 1801, Lasson, *Erste Druckschriften*, 378.

39. In one sense, the Evil Spirit is necessarily as old as the Good one. So the “Dark Essence” is the Lord of Evil just as the Light Essence is the Lord of the Good. But I am not counting these “essences” as “spirits.” Their communities are constituted by nature, not by free choice. Properly speaking, there are no “spirits” in the “natural religions”; and there is no “Evil Spirit” in the Art-Religion. (About the logical status of “the enemy” in Judaism I do not want to be dogmatic. His appearance in the Book of Job as one of God’s “servants” suffices to establish my point—or if that is not thought to be enough, then I will give it up.)

40. It is a general complaint of students that Hegel’s interpretation of Boehme, though it *uses* many texts, leans too much on the early *Aurora*—see especially R. F. Brown, 1977, and D. Walsh, 1984. I think myself that this is because Hegel recognized the uniquely philosophical or speculative drive of this early work. Boehme’s desire to be “orthodox” is at the bottom of the more complicated doctrines found in his later work. This complication (and especially the *doubling*, or distinction between God’s life and ours) is of no speculative interest. It merely reflects the estranged condition of the world of Culture. Boehme’s greatest insights (like those of Eckhart) came at the moments when he broke out of this conceptual frame (which was typical of all orthodoxy). Hegel’s *speculative* interpretation of Descartes is *selective* in the same way, and for the same reason. (Compare C. O’Regan [1994, 132]. His comments on the influence of Boehme on Hegel’s theology—which can be traced exhaustively in his Subject Index—are uniformly helpful and enlightening.)

41. See J. Boehme, *Sämtliche Schriften* (ed. W.-E. Peuckert), I, 161–162, 194 etc.; trans. (1960, 88–89, 334–383 etc.). The “double Fall” or two-stage engendering of evil in this paragraph is discussed from a theological standpoint by E. Schmidt (1952, 186–193). Compare also C. O’Regan (1994, 155–156). On the significance of Lucifer cf. W. Desmond (1992b, 204–205). Desmond has written a long essay on the Hegelian concept of evil (1992b, chap. 4). He finds that the discussion in this section is “equivocal” (1992b, 192). One cannot deny that several kinds of uncertainty are possible. But Hegel has here returned to the level of ordinary common sense.

42. The Anglophone reader should rely on Baillie (not Miller) at this point.

43. There are a number of discussions of God’s *wrath* in the *Aurora*. But see especially, *Sämtliche Schriften* (ed. W.-E. Peuckert), I, 105, 183.

44. Because of his doctrine that Spirit is the beginning and the end, Hegel is not quite orthodox (cf. Whittemore, 1960, 151). J.M.E. McTaggart (1901, 201–205) argued on these grounds that only the Holy Spirit is truly God. His mode of argument is cogently criticized by R. K. Williamson (1984, 165–166). But when it is rightly understood, his claim expresses an important truth.

45. Hegel’s theory of “evil” is contextually located by W. L. La Croix (1971).

46. The champions both of the Neoplatonic concept of Evil, and of the Spinozist identity of God and Nature, were Schelling and his disciples. Compare Rosenkranz, 188; *G.W.* VII, 34, lines 16–18; see further Schelling, *Werke* VI, 38–42; and IV, 307 (Vater, 203). Hegel’s insistence that Concepts cannot be expressed in *Vorstellungen*, and that even Boehme was not successful here, represents a disagreement with Schelling, and a criticism of his mode of presentation. But Hegel himself employs Boehme’s *Vorstellungen*; and he himself is *interpreting*

the philosophy of Nature of Schelling's *Bruno*. His rejection of Schelling's neo-Platonism is more radical. He does not agree that metaphors like that of the Fall should simply be taken over, and used by philosophers. But I think he saw this as a discord within a concord; he had been attacking the "Fall" metaphor for several years in Logic lectures, while at the same time insisting on his sincere respect for Schelling—see *G.W.VII*, 34 (Burbidge and Di Giovanni, 36) and *Night Thoughts*, 400–402. There are epigones both of Schelling (especially Eschenmayer) and of Jacobi (especially Köppen) at whom his dialectical explanations are far more directly aimed. Schelling is mistaken in thinking that these *Vorstellungen* are, or can be made, adequate for the expression of properly speculative truth. But it is his merit to have seen that these *are* the *Vorstellungen* in which the truth is most nearly visible. Where Hegel's own theology takes leave of the orthodox tradition it is because he *agrees* with Schelling. In 1807 that fundamental concord was still more important than any *disagreement*. Of course, when Schelling himself failed to see this, and continued to do philosophy in the theologizing mode of *Vorstellung*, the situation changed. But Hegel's belief that there was no reason why they could not be friends even in the 1820's demonstrates the persistence of the attitude that I am ascribing to him in 1807. Compare H. S. Harris, 1987 and 1989.

47. Even the "Animal-Religion" must be admitted to have some positive value (as the foundation of "concreteness"); but the "Roman religion" is not embraced within the range of my generalization. (The *Herrenvolk* concept of the Nazis was a conceptual synthesis of these two moments. Only the face of "the enemy" can be seen in it. We must "comprehend" it certainly, but only as Unhappy Consciousness.)

48. The "name of Jesus" belongs to that *dead* Savior—the sublated "essence" of Sense-Certainty—so the two meanings of *besondere* coincide.

49. For a translation of the Analysis (keyed to Hoffmeister and Baillie) see Kojève (1969), 261–287. Our reference here is to page 287.

50. For a sounder interpretation of "Hegel's Atheism" see Paul Lakeland (1980). Kojève's humanist "Wisdom" still smells strongly of the cultural imperialism of Western historical reason that Nietzsche attacked so brilliantly. See his *Use and Abuse of History* (1957, 51–52).

51. Compare the end of paragraph 779, which is where the "spiritual resurrection" was mentioned before.

52. Compare further the commentary on paragraphs 670–671 above; and the commentary on paragraphs 228–229 in *Pilgrimage*.

53. See W. James (1909, chapter III). That we find this moral valet's judgment in a great psychologist, devoted to the ideal of comprehension, is an index of how far the religious climate of James' time was from the spirit of "science" as Hegel understood it. But we must not blame James alone for this; his view that the world needed *improving* on the basis of scientific understanding was only the obverse side of the academic otherworldliness which believed that it possessed, in its curious amalgams of Christian neo-Platonism with Hegel, a purely theoretical access to the supersensible world that is behind or beyond "mere" experience. The Absolute that James attacked deserved to be attacked; only it was *not* (as he thought) the Absolute of *Hegel*.

54. P. C. Rasmussen (1972, 103) is probably thinking of Nietzsche when he asserts that Hegel's thought is the first to say "God is dead." Since the death and resurrection of God is an element in every developed religion this is an empirically improbable proposition if taken abstractly. But what matters more is to insist that Hegel is the first to give a *philosophical* account of the *Resurrection* of God and man together. I find myself much more in sympathy with the argument of J. W. Burbidge (1992, chapter XIII) who uses this paragraph to estab-

lish that Hegel really is a “Christian.” But I have to say that the paragraph is, at most, Hegel’s final observation as the philosophical *historian* of Christian experience. For a mere *observer*—like myself and *my* Hegel—the question is more clearly answered by E. Black (1977, 209). (D. S. Pacini [1987, 116–118] radically misinterprets the concept of God as Spirit.)

55. “God’s forgiving Himself” is a logically absurd locution, because He can only manifest what He logically (and hence “unchangeably”) *is*; but there have been many religious souls who have “hardened their heart” against God, and have needed to “forgive” Him. The most vivid example known to me is that of Heloise. The way that Hegel (and I myself) see the question is partly a function of personal psychology.

56. The quotation comes from my memory of a conversation many years ago with A. A. Nemetz. I have not managed to find it; and I dare not claim that my memory is perfectly accurate!

57. The “openness” of the future is identical with its *mysteriousness*. In this sense the Hegelian philosophy of religion retains “mystery.” In general, we can afford to smile gently at the arguments of A. K. Min (1983) in defence of this thesis. But his Kantian description of Hegel’s procedure as “*presupposing* the givenness of a fact” (1983, 349) must be rejected. The only *facts* involved in Hegel’s doctrine can be *observed* by anyone at any time (specifically “the appearance of the belief of the world”). Hegel aims to remove *all* mystery from our comprehension of the past. He achieves this end by interpreting the *Vorstellungen* of religion aesthetically—cf. M. Donougho (1982, especially 490–498). (The theory of “appearance” is necessarily “aesthetic,” but it should not be *reduced* to *aesthetic theory* as in H. P. Kainz (1972). Donougho’s *semiotic* approach is the right one.)

58. Kojève (as we have seen) was a “Hegelian” only in a grossly distorted and impoverished sense. But, by the same token, Ernst Bloch was a very good Hegelian indeed; and the whole tradition of the “Frankfurt School” belongs within the Hegelian Church. R. Ahlers (1978) offers a valuable outline of the complex relations between Hegel’s philosophical theology and the Enlightenment (both in his own time and in ours).

M. Westphal (1987b) has noticed the problem created for the general thesis that “Religion is the foundation of the State” by the fact that Hegel’s “Protestant principle” makes religion sectarian. He does not admit that secular humanism is another form of Protestantism. But he ought to. He would then be on the way to the conceptual (philosophical) solution to the problem (as we can readily see in his own essay of 1974 = 1992, chapter 11). It always remains true that the real world has to solve its own *real* problems; but we must not engage in “spiritual” polemics about this under the mistaken impression that we are doing philosophy. That only makes the problems worse.

59. C. Taylor (1975, 178) rightly says that in the modern Nation-State “men . . . accept their identification with external social reality . . . but . . . they do not feel *bei sich* in it.” Hegel aims to restore our sense of “being-at-home”; but we cannot regain the immediate *Beisichsein* of Greek *Sittlichkeit*. One can plausibly argue that our own century has taught us how dangerous it is to be *bei sich* in our political community. It is by redirecting our *religious* consciousness to the human family in this world, that Hegel’s philosophy restores *Beisichsein*. Atheistic believers in the “class war” are entitled to call Hegel’s way out “chimerical” (W. Becker, 1971, 121); and believing Hegelians can argue that “bureaucracy” must be “humanized” as much as possible. But the Hegelian sense of *Beisichsein* involves acceptance of the fact that conflict can never be eliminated (compare M. Franklin, 1960a, 1960b).

60. Perhaps, since this is the Phenomenology of *absolute* Spirit, we ought to refer to the *empty tomb* here. This “middle” refers us to God’s Kingdom in the Beyond. But the speculative inversion in Absolute Knowing requires us to show where “Phrenology” fits in the circle of Manifest Religion.

61. Compare paragraphs 531–533—here we have a moment of direct and explicit coincidence between finite and Absolute Spirit: the first moment of Absolute Spirit is identical with Objective Spirit as Thought.

62. Since the Unhappy Consciousness persists here only in the logically irremovable aspect that we all live from day to day and “the Kingdom never comes” this moment is now simply the finite singular aspect of the world of Spirit defined below.

63. B. Baugh (1991, 72) has shown that Kojève inherited from Koyré the mistaken view that “human time is primarily futural” in Hegel’s Jena thought. I do not want to give comfort to any heresy of that kind.

64. According to my interpretation, the overcoming of the “alien [*fremd*] satisfaction” is simply the sublation of the *orthodox* Christology (liberally interpreted, see note 19 above). M. Miller (1978, 198) describes the “contradiction” correctly. “The subject as religious knower, remains opposed to what, through religious knowledge, it knows itself to be.” When this contradiction is overcome, the subject becomes directly a member in the “procession of God’s infinity” in paragraph 808. Thus Findlay is (rather too prosaically) *right* about the “Absolute Knowing” of the *Phenomenology* (1958, 144). Writers like Flay (1984, 237) who say that “Once interiorized, there is no objectification, no representation, no simple transcendence of what is represented” etc. make the final “procession of the Spirit” incomprehensible. They are confusing the “absolute knowing” of the *Phenomenology* with that of the *Logic*. (For this necessary distinction see the commentary on 799 below.)

Chapter 13

The Republic of the Learned

VIII: Absolute Knowing

Hegel's last chapter is concerned with the closure of his Science of Experience into a proper conceptual circle. With the speculative comprehension of the universal community of humanity in its history we have reached the final Gestalt of Spirit as a "world" (the We). In Hegel's sixth chapter ("Spirit") we comprehended the human community as a substance that finally becomes subjective in its members as free self-defining individuals. We saw how the comprehension of our self-interest, our moral bias, our finite mortality, and our relation to the dead was crucial to this transformation.

Then in chapter VII ("Religion") we studied the absolute concept of the communal substance; that is to say we comprehended the context of nature and history within which the human community has its being. "God" is the absolute Concept that human communities have developed for this task of absolute self-comprehension.

Now that we have formulated that concept as adequately as possible, only one task remains. It is a task with two faces. On the one hand, we have to show how the absolute concept comprehends all of the "experiences" that have led us to it. On the other hand, we have to show how we (as singular consciousness) comprehend it—or how it is incarnated as a Concept in the thinking individual. These are facets of one task because the closing of the circle, the recapitulation of the science in our minds, is the adequate formulation of the absolute Concept as a concept. We all embody the Concept (before we do any philosophizing at all) because it comprehends us; it provides the context (both practical or "real," and theoretical or "conscious") of all that we intelligently say and do—and of everything that we understand about what is unintelligent. But to embody it as a concept is to raise it to the level of explicit consciousness on its theoretical side. The concern with conceptual structures, or with "logical necessity," is what distinguishes "philosophers" generally. Most of us do some practical philosophy, when we are in problematic or conflict situations (or at least we are grateful when others do it for us). There is a smaller tribe who enjoy doing it theoretically, but in a piecemeal way, by studying the conceptual structures of finite ranges of experience shared by particular communities. But we (meaning those who have followed out the project of the "Science of experience") have formulated the concept of the absolute community, the "we" that comprehends all experience. We must now finally discover what structure that has developed in us as "I." That will be the conceptual awareness of "absolute knowing."¹

(a) *The Final Problem*

- 1./788. The spirit of manifest religion has not recognized its conscious object as its self. God's community as absolute Spirit is its *imaged* object. The form of the final transformation must have appeared already. It is not a one-way process but a circle. It is to be shown that the *thinghood* of consciousness is posited by the emptying of self-consciousness; and the positing is to be at the same time a recuperation. Our complete display of the relations of consciousness to the object has shown that they are all aspects of the Self.

Hegel's Absolute Knowledge is simply the self-conscious awareness of what the "manifest religion" of the universal human community really means as a concretely logical experience of the individual thinker in (and for) the community. We have now understood that the function of Religion in human life and experience is to express the universally shared consciousness that a community must have (if it is a community of rational consciousness). Religion is the consciousness of the community's relation to the world, and of its own self-cognitive structure (as a unity with many members). When that actual structure is fully consistent with itself as cognition, then the community is rational. Knowing this, we can see that, if there is to be any "absolute knowledge" it has to be the knowledge expressed in the religion of a community which has arrived at a rational relationship with the world, and with itself; it is the knowledge that is finally and demonstrably necessary (in a logical sense, and not just as a matter or received general conviction) for the complete realization of human Reason. Reason is not "common" to humans in the way that their body skeletons are. It is communally recognized, because it is the constructive achievement *of* the human community, by the community.

Hegel's "*science of experience*" only becomes possible when the religious consciousness of the human community has become completely *rational*, i.e. when we can show that it is the objective expression of a logical consciousness of what human rationality (theoretical and practical) really *is*, and of what the natural boundaries and social conditions of its realization are. The social structure of the community—our universally shared consensus about how we ought to act, and how we are to treat one another, together with our consensus about "values," i.e. about the goals which make life "good"—all of this (and the institutions by which the consensus is maintained and where necessary enforced) is the substance of Reason.²

As singular organisms, none of us could be "rational" at all, except through the self-perpetuation of this "substance" in the education and cultural formation of ourselves, and those with whom we live. The idea that we are all endowed with Reason "by nature" and that it unfolds "naturally" in us, is an error of the Enlightenment, from which the speculative recollection of the history of how our Reason has actually developed, decisively frees us. If we were not the spiritual offspring of a religion that teaches us that all human beings are the children of a God who is supremely rational, and who loves us all equally to the point where He took our nature (with all of its limits and sufferings) upon Him in order to exist for us as

“Spirit,” we would not have the concept of human rationality (theoretical and practical) that we *do* have.

Aristotle, for example, did not have this concept. He was more impressed by the evident fact that humans differ in their rational capacities, and in what they take to be rational. Living in a world that had *no* universal religious community, it was obvious to him that Greeks were rational, in a way that barbarians were not, and that among Greeks, free male citizens were—or at least *ought* to be and *could* be—rational in a way that women and those born in servitude were not and could not be.

In the absence of a religious consensus that mankind is *one* community under the fatherly eye of one God, any proposed “absolute knowledge” of what human Reason *is* could only be Utopian;³ and that religious consensus took a long time to evolve into a logically consistent form. Having identified that form for us, Hegel must now show us that the consensus involves an unselfconscious recognition of what *we* know the rational function of religion in society to be; and secondly, that when this unselfconscious knowledge is logically interpreted, it provides a functionally complete and coherent concept of what human rationality *is*. The two tasks are logically distinct, but in the context of the science of experience, they turn out to be identical. Our scientific analysis of what history has shown to be involved in a subjectively free, but socially substantial rational life, culminated in the same community of self-conscious religious *absolution of sin* to which our analysis of the actual religious tradition has now returned. In order to show that this community must know what religion *is*, and further that its religion is the actual concept of its experience, all that we have to do now is to repossess the earlier stages of our Science, as the conceptual *truth* of the traditional *Vorstellungen* of our religion. What makes it certain that this can be done is the fact that according to our religion God, the absolute essence of pure thought (or abstract Reason), became Man and accepted human death in order to exist as “Spirit.” This *Vorstellung* is visibly and unmistakably identical with the *concept* of Reason to which our critique of “truth” has brought us: Reason is the living substance that becomes subjectively self-conscious in these mortal organisms whose intercommunication constitutes the distinctively “human” (or *free spiritual*) world.

Religion continually refers to the eternal aspect of Reason in its purity, as if it were a supersensible Beyond. Being absolute, and hence “eternal,” it seems that the categorical “truth” of experience must simply *be*, in a sense and a way in which we *are not*; but the Hegelian concept of “Spirit”—combined with the concept of “the Spirit” that we find empirically in our religion—sublates this necessity, and makes “eternity” a moment of “time,” just as “time” is a moment of “eternity.” By bringing out this identity, the *philosophical* interpretation of God’s Incarnation sublates His absolute otherness.⁴

Scientifically there is no need to use the name “God” at all, and there are sound arguments against doing so (see par. 66). When the religious *Vorstellung* is turned into “Science” we find continually that as the arrow of signification is bent back from the sphere of pure thought to the experience of the actual world, the overt meaning of the *Vorstellung* is radically inverted. Hegel always maintained

that Religion and Philosophy were the knowledge of the *same* “content” in different “forms.” But those who think that the change of “form” leaves the truth of “Religion” effectively untouched, are deceiving themselves either about what Hegel meant, or else about their own (not yet properly Hegelian) relation to the *faith* of the religious tradition from which Hegel’s language is derived; in traditional terms the transition from Religion to Philosophy in Hegel is the transition from Faith to Reason.⁵

Hegel accepts the claim of his religious tradition that “Faith is a kind of knowledge”; and we have seen what a vitally important “kind of knowledge” it is. It is the universal context of all the “knowledge” that saves us from a Hobbesian chaos. But equally Hegel accepts the dogma that faith is an *imperfect* kind of knowledge; and when he claims to turn it into absolute knowledge, he is quite consciously and deliberately claiming to do away with its “imperfect” character as “faith” altogether. Religious “faith” is finally, completely, and *absolutely* liquidated in Hegel’s “Science.” Kant claimed to have set “limits” to Reason in order to “make room for faith.” Hegel can be seen as a conscious successor of Kant, in that he took it as his task to show that Reason is “infinite,” and hence that “rational faith” is philosophically quite superfluous.⁶

Reason is self-generating and self-sufficient within experience; or to put it another way, we know what “Reason” means, when we discover the interpretation of “rational life” that is comprehensive and self-validating within experience, so that no “postulates” that transcend experience are necessary. Specifically Hegel does away with the Kantian postulates (God, freedom, and immortality) by showing what the rational interpretation of the terms in actual experience is. All of them are transfigured by being absorbed within the domain of Spirit (as the most comprehensive concept of actual experience); but of them all, the postulate of “God” is the one that is most radically affected.

The “content,” which has now to be transformed from *Vorstellung* into *Begriff*, is “the absolute Spirit.” In our *Vorstellung* this is the Holy Spirit that descended at Pentecost, making the disciples of the dead Savior capable of communicating with everyone in their own tongue (Acts 2:1–41). The “truth” of this image of the Spirit *must*, says Hegel, “have yielded itself in the shapes of consciousness.” There is nowhere else for it to be, if it is not in the Beyond of religious faith. The chain of experiences led us up to the community of mutual absolution, and the evolution of Religion into the *Vorstellung* of God as Spirit has brought us back to that; so there is nowhere to go now except backwards.

How far back must we go? Not surprisingly, the answer is “all the way back to the beginning.” But the most important point is that which this present commentary has identified as the halfway mark. Hegel himself identified the beginning of Self-Consciousness as the crucially important point of returning reference; for he said that Self-Consciousness was “the native land of Truth” (par. 167); and it was there that he introduced the concept of Spirit (par. 177). But for the comprehension of the definition that he gave there, the critical moment must necessarily come later. It arrives when Reason, possessed already of the “certainty of being all reality,”

comes face to face with its own finitude as an observable object. What Reason observes then is the death in which it vanishes; its object is *the skull*, an object which can in fact tell it nothing about itself, except that it is a human mortal. This is where our Science begins to unfold for us the religious *Vorstellung* of God as mortal; for (in religious terms) “Reason’s certainty” is the certainty of being one with God; and “Reason’s truth,” as observer, is *mortality*. So “the death of God” is the moment upon which the “absolution” of the religious *Vorstellung* turns. (This present paragraph reviews the “biography of God” as summed up in chapter VII.)

“This overcoming of the object of consciousness is not to be taken as the one-sided one, that the object showed itself as returning into the Self.” The “object” is the “absolute Essence,” and this “onesided *Ueberwindung*” of it was the climax of Greek Religion in the comic consciousness that the Self is the “maker of Gods.” So the “overcoming of the object” that Hegel means, is *not* that (though I suppose Kojève would have said that that is exactly what it was)

... but more precisely this, that the object both [*sowohl*] displayed itself as such to the Self as vanishing; and equally, but more significantly [*als noch vielmehr*] that it is the alienation [*Entäusserung*] of Self-Consciousness that posits the thinghood [of the Self], and that this alienation has not only negative but positive significance, significance not only for us or in itself, but for Self-Consciousness itself.”

Let us see what we can make of this conundrum.

This comprehensive *Ueberwindung* of objectivity is what is achieved by the long process of the Unhappy Consciousness raising itself to full rational Self-Consciousness. The Unhappy Consciousness is the Comic Consciousness that has alienated *itself* into the Unchangeable. In the experience of the *Weltgeist* the “emptying out that posits the thinghood” of the Self is the *Rechtzustand*, in which all self-conscious beings are defined as legal “persons,” or thought-things. Thus the “positing of thinghood” is quite clear and explicit for the self-consciousness that we are observing at that stage. But this alienation of the Self in Law includes the legal authorization and regulation of religion which is the “vanishing” of the Gods—who were the objective essence of social life in the world of the natural communities. This loss of the Gods receives a *positive* significance, through the movement of Faith. The world, in the person of its self-conscious Lawgiver (Constantine), gives itself up to the Unchangeable Law of God’s unfathomable Reason, in the secure knowledge that that Unchangeable Law is humanity itself: “in this emptying-out it posits *itself* as the object, or (in virtue of the indivisible unity of *being-for-self*) it posits the object as itself.” Faith knows that God is Man, that the eternal Reason is necessarily embodied. It “*knows* this nothingness of the object” (or “the self-sublation,” the double negation of the object “has a positive significance”) because it alienates its own self *into* the object.

The “emptying out” (*Entäusserung*) is a description of “salvation by faith” which Faith itself can recognize—but the description of the God to whom it gives itself up with absolute trust would be strange to it. We have grasped the “nothingness” of Reason as natural necessity, because we have already recognized (in

observing the Understanding) that the “world of laws” is identical with our own human Reason. This “nothingness of Nature” is the theological “nothing” out of which the world was “created” (compare the last part of par. 780). Hegel understands “Creation” as the continuous process of *our human interpretation* of the world natural and spiritual.⁷

The surrendering of the human will to God’s Will is only possible because God’s real identity as human Reason, his necessary humanity, is recognized. Thus, as Hegel puts it, “there lies herein [i.e., in the positing of itself as the object, or the object as itself] at the same time this other moment: that it [self-consciousness] has also sublated this emptying-out and objectivity just as much, and has taken it back into itself, so that in *its own* otherness as such it is at home [*bei sich*].” This “other moment” is implicit but it is deeply buried; it takes a long time to emerge. Faith knows that it has surrendered its will to God, as the Unchangeable Law; and it knows that it has done this because God appeared in human shape, and accepted the fate of death. So it even knows that in this surrender it is *bei sich*, it has come home. But the conception of this “homecoming” is all upside down, because it takes the home of its longing to be *elsewhere than here*.

The whole journey of the *Phenomenology* is necessary in order to disabuse “Reason” of this dialectical illusion. But our familiarity with Hegel’s method tells us that we should take paragraph 788 as a review only of the *repetition* of the whole journey on the part of “the Infinite” in chapter VII. In chapter VII the genuinely “substantial” spiritual Self-Consciousness, the *self-conscious human community*, has repeated the whole movement of the finite Consciousness. It has related itself to the object (i.e. to its own “absolute essence”) and has grasped it in every conscious way. As a result the object (i.e., what is ordinarily called “God” in our language) has in truth become for consciousness the “*spiritual* essence” that it is “in itself.”

Unless we take the intended reference to be to the *repeated* journey, we cannot make sense of Hegel’s claim that the object “becomes this [i.e., the spiritual essence]” . . . through the apprehension of each singular one of them [its determinations] as [a determination] of the Self, or through the *spiritual* [my italics] relationship to them just mentioned.” For it is only after chapter VI (*Spirit*) that the consciousness we are observing can have a *spiritual* relationship to its “determinations.” In chapter VII the community recognized its own Reason (or Spirit if you prefer, but it must be remembered that Spirit is the *positive*, or “concrete,” reality of Reason) as the life-and-intelligence-giving Light, as the Life that posits the Living Thing, and as the Understanding that reduces objective reality to dead raw material for craftsmanship. In this last shape it identified itself as Bondsman; and in the aesthetic religion of Greece it enjoyed Lordship. Tragedy was the absolute shape of Stoicism, and Comedy of Scepticism. The Unhappy Consciousness of the *Weltgeist* is the Roman Imperium; and the advent of Reason is the coming of the Savior.⁸

This advent of Reason involves a long *Bildung* of Unhappy Consciousness into universal Faith; and the downfall of rational Insight into Phrenology is the “sign of the times” for the reconciliation of Faith with the Insight of the individual

consciousness. In the Christian Unhappy Consciousness (its “second relationship”) human Reason is in quest of itself as an object of Observation; and the Crusade for the Holy Sepulchre is the reduction of Religion to Phrenology. What comes forth from this meeting point is the Manifest Religion that can take cognizance of itself as Absolute Knowing.

- 2./789. The object of devotion is partly a thing-in-itself (singular object of spiritual sense), partly a thing for itself and for another (spiritual perception), partly a pure essence (intelligible universal). As a whole it is a syllogistic process both ways from universal to singular and back. But it is not the pure *comprehending* of God that we are now discussing. We shall review only the side that belongs to us. God as “essence” is not our concern, but only as “shape of consciousness.” This will involve our picking out a number of the earlier shapes in which both the totality of God and the behavior of [finite] consciousness can be demonstrated (though only “dissolved in the totality’s moments”).

Hegel himself now correlates chapter VII with the story of Consciousness in chapters I–III. These first three moments—the moments of theoretical Consciousness itself—are of crucial importance to his problem in the present chapter, because “the object appears in consciousness as such not yet as the spiritual essentiality . . . but partly as shape of consciousness in general, and partly as a number of such shapes which we collect together.” There are *three* of these shapes (identified progressively in pars. 790–792) “in which the totality . . . can be pointed out only [as it is] dissolved in its moments.” These three shapes answer to the correspondences between chapters I–III and VII established here.

The parallel is complex, because it embraces Hegel’s seventh chapter as a whole; but the crucial application of it is to the section on the Manifest Religion, because it is the “object” of the Manifest Religion that has now to be turned over into the “Subject” of “Absolute Knowing.”

Let us get the more general parallel clear first. “The object is in part *immediate* Being.” This is the “It is” of Sense-Certainty; and all of the modes of Natural Religion are subsumed here under the “It is” (although, as we have already seen, they also exemplify the three stages of Consciousness). For Natural Religion God is simply (and immediately) *there*. There is no distinction yet between His being-for-self and His being-for-another; and there *cannot* be any, because no “other” has any independent essence of its own.⁹

Secondly the object is “partly an othering of itself, its relationship, or *Being for Other* and *For-Self-Being*, that corresponds to Perception.” This is how God is experienced in the Art-Religion; we make the Gods in our own image, while at the same time regarding ourselves as their servant, and envisaging our own free existence as a play for the Gods. God is thus an ambiguous *relationship* of Being for Other and For-Self-Being, just like the “thing and its properties” in Perception.

Lastly, the object is “partly *essence* or as Universal, which corresponds to the Understanding.” This is how God is experienced in the Manifest Religion. Here He is the rational Force whose essence is to manifest itself. It is the repetition of the

same three stages in His manifestation as “Essence or Universal” that is our more particular concern.

First, He is “immediate Being, or a thing in general.” He is manifested as Jesus, the living thing who dies in order to become the Universal Logos; and in the tomb he is “a thing in general.” Secondly the Divine Logos is the ambiguous relationship of *Being for Other* and *For-Self-Being*. As the Ascended Lord, Christ is both the Mediator and Savior of all who “believe on Him,” and the eternal Logos “by whom all things were made.” Finally Christ as the Spirit is “Essence or as Universal” in the community to which He is manifest as its “Spirit.”

In this movement of consciousness there is a “syllogism” that goes both ways: the universal goes through determination to singularity, and conversely singularity goes through determination by sublation, to Universality. God comes down, through birth, to human embodiment; and the human being ascends through death to spiritual community.¹⁰

But what we are now concerned with is not this comprehensive totality of human experience. We aim only to characterize the “knowing” that comprehends it. We need to show that it is a mode of human truth-seeking and finding: “But this knowing is to be pointed out only in its coming to be or in its moments, on the side that belongs to consciousness as such.” Here Hegel is speaking programmatically, and telling us what he is going to do; and he does go on at once to identify three moments in the “coming to be” of *Wissen* “on the side that belongs to consciousness as such” (rather than to the “comprehensive totality of the essence”). The obvious problem is that no justification or explanation is given for his picking out just precisely these three moments which he selects in fulfilment of his programmatic promise. His procedure in paragraphs 790–792 appears to be a matter of arbitrary subjective *insight*; and that contradicts his claim that all we need to do is to *observe*. Let us see if we can find any logic behind this outward show of free choice.

The object of our “observation” ought, logically, to be the one that we have methodically arrived at. That object is the “manifest Religion.” If we take Hegel’s “soll nur . . . nach der Seite aufgezeigt werden, die dem Bewusstsein als solchem angehört” to refer to what the faith of this religious community requires (and not just to a subjectively insightful programme of Hegel’s own) then we find that the problem of a lack of continuity does not arise. After the first step that identifies the new “shape of consciousness” the development follows *its own* logic (as usual). Since I have far more respect for the methodical coherence of Hegel’s thought-processes than I do for his style (especially since by this time he was writing in a great hurry)¹¹ this is how I shall proceed.

As we saw already, the moments which, as far as the religious community is concerned, “are to be pointed out on the side that belongs to Consciousness as such” are “Jesus as the man who lived and died,” “Christ as the Logos,” and Christ as the “Mystical Body” of which we are all members. The faith of the community is not conceptual knowledge, because it needs all three of these. They are all *one* (Christ Risen); but the second presupposes the first, and the third presupposes both of the others. The third is the mode of Christ’s presence *now*, in the Spirit; and this is

what makes the Manifest Religion absolute. But this third mode is unthinkable for faith, without the historical presupposition of the Crucifixion and Resurrection, and the logical presupposition of God as the Logos.¹² The totality of the moments of the Concept can be recognized in each of the “shapes”; but the three shapes are “taken together” by the religious community without any effort at the speculative comprehension of their oneness. Since “we” (the philosophical observers) want to achieve precisely this speculative comprehension we shall now “pick them out” in their abstract otherness as the simple “shapes of consciousness” that we have encountered already. The first is a shape of “Reason”; the other two are shapes of “Spirit.” This answers to the logical character of the religious moments: the first is a singular rational being; the others are universal shapes.

(b) *The Recapitulation*

- 3./790. We just have to pick this earlier cycle out. We saw Observing Reason find itself as a *singular object* of sense and declare the being of Ego to be a “thing” (pars. 344, 346) (and not an invisible thing such as the “soul” either). This completely unspiritual judgment is conceptually the richest for spirit.

The three *Gestalten* of the Savior in Faith will be easy enough for us to unite conceptually as soon as we identify them in the order of our scientific progress to the Concept of the Community (which we had reached when the transition to Religion became necessary).¹³

It is obvious already that the last of them is the Concept that underwent that transition; and the first of them is not much harder to recognize. We were able to identify the *immediate* objectivity of the “absolute essence” at once as the *God who appeared*; and we have seen already that for the “belief of the world” to appear, the Divine Man had to be long dead. The whole movement of Observing Reason was a search for itself over the complete range of the “absolute essence” as a world of immediately sensible, perceptible and understandable objectivity. This is the range of finite being with which God has to be reconciled according to the theological *Vorstellung* of the Incarnation. Christ, as the Logos, must live, die, and “descend into Hell.” Observing Reason makes the conceptual pilgrimage of our own scientific community, in which this divine experience gets its universal significance.

John (1:10–11) says of the *Logos* that “He was in the world, and the world was made by him, and the world knew him not. He came unto his own, and his own received him not.” The experience of Reason (which has the Johannine “certainty” that it is the Logos) is rather that it is in the world and it does not know *itself* there; that it “comes to its own” (in the Observation of Self-Consciousness) but cannot be “received”; and it finally encounters “itself” as the skull-bone of the phrenologist, in which all that can be read unambiguously is “Death.”

Hegel made it clear at the time (and he reiterates now) that this absolute defeat was an experience of enormous significance. It is the recognition that “*the Being of the Ego is a thing*” that forces us to make the transition from the natural “subjectivity” of

Reason to the recognition that Reason is a social Substance. This “substantiality” of Reason is “Objective Spirit.” *The mortal “rational beings” are only able to make the social Substance because it reciprocally makes them able to make it.* In their natural “substantiality” (the skull that houses their living intelligence) there is absolutely nothing rational. Phrenology reveals to us the exact “nothing” out of which “all things were made.” The real being of the rationality of humanity is not to be looked for inside us as natural organisms at all, but rather in what we do to the outside world which abides “substantially” when we are dead. Only when this “uttering” of the rational self has been comprehended, can we return to the inner world of Self-Consciousness and comprehend substance as subjectivity.

This then, is the speculative meaning of the life and Passion of Christ. Reason must be embodied and must die, in order to “create the world” in which it can know itself as Spirit. Once this has been comprehended, the symbol of Faith is sublated. We still know that the experience was *historically* necessary; but the very reason why it was historically necessary (to make the logical truth *objective* for “the world”) is the reason why it is no longer necessary now that its logical function has been completely fulfilled by comprehension. There is a deep truth in the saying of Jesus to his disciples, “It is expedient for you that I go away” (John 16:7). For until the illusion that the universal community of forgiveness depends “necessarily” upon a founder “goes away,” the religion of the Concept, the religion of Jesus himself, will not perfectly exist. This is what chapter VII has added to the “spiritual riches” of the “non-spiritual” judgment of Phrenology that *“the being of the ego is a thing.”*

- 4./791. But this *sensible thing* only has meaning through the relation of the Ego to it as active. That is what we learned through pure insight in the Enlightenment [see esp. pars. 560ff. and 580–581]. The thing-world is for use. The alienated experience of “culture” begot the thing as the self, and sense-certainty as the only truth [cf. par. 558].

Speculative comprehension of the “infinite judgment” (i.e. the logical absurdity) of Phrenology leads us straight to the proper speculative interpretation of the “Logos by which all things were made.” For the Logos by which the world of Objective Spirit is created is the Enlightened Gospel of universal utility. The natural self-consciousness already knows that the world of consciousness has no independent essence; every natural self knows that “the world is my oyster,” and everything in it is for my use and enjoyment—compare Locke’s theory of the origin of property. But the rationally universal form of this (according to which “Nature” is the sum-total of its use-values for the human community as a universal brother- and sisterhood) is the work of Insight and Enlightenment.

It is in this world of socially active Reason that Faith is first seen and declared to be what it actually is: the production of the In-itself by consciousness (par. 566). Enlightened Insight sees only the absurdity of this “anthropomorphic” projection, not the deep truth of it that is unveiled by Hegel’s speculative interpretation of the Incarnation; for Insight is still caught up in the conception of itself as “pure subjectivity” (i.e. as independent singularity). But now we have comprehended the

substantial community for which “Nature” is the sum-total of use-values; and we have seen how the pre-conscious projective act by which every community objectifies its own self-conscious unity as its *Vorstellung* of God was essential to its substantiation. “Substantiation” is something very different from the liberation of Reason as “Absolute Freedom.” The rationally substantial community can now properly comprehend the “truth of Enlightenment”; it can see and say with Insight, that the God who created the world “out of nothing” is its own communally embodied Reason; and that as the circle of substantial community and subjective insight, this Reason should more properly be called “Spirit,” because its totality—which we have still not quite reached—is a spiritual community of the living, the dead, and the unborn in the *logical* substantiality of thought.

As an object for consciousness, the real human community is made up of “Ego-things.” These things are natural self-consciousnesses, things that assert themselves, and are *for* themselves. Each of them is *ein fürsichseiendes*; but this being-for-itself is only a moment in the life of the community. It passes over into the spiritual Being-for-Other of the Incarnate Logos that has returned to Heaven. This is the “use-value” of the human natural self; and in this way the second moment of our conceptual progress incorporates the sublated shape of the first, so that it does not need to presuppose it.

- 5./792. This thing of spiritual perception must now be *understood* as the essence of the self. This happened in the Moral World-View where the alternation of Stoic moral independence and world possession was stabilized as *Conscience*. (My knowledge of the world and my decision in it is *me*.)

The transient thinghood of Spirit as Sense-Certainty is, on the one side, the “Divine Man who died,” and on the other side Yorick (as the representative of every human who comes into the world); the permanent thinghood of Spirit as Perception is the natural world in and upon which we labor (and the divine-human Logos that creates its utility). It first came before us as the permanence of the “Shaped Unchangeable” from which the Unhappy Consciousness received its guilty and self-renounced, but inevitable, enjoyment (par. 220). Here we can see its ambiguous identity with the incarnate Logos, as the reconciliation of Evil within the motion of Goodness. For enlightened Insight it appears in its simply alienated object, as the Nature that is the source of all “goods”; but in that one-sided perspective it brings forth the “evil” of universal death. This is the thinghood of Spirit “according to its determinacy.”

Finally, therefore, we must comprehend Absolute Spirit in the mode of Understanding, or as an “intelligible force.” This came before us first when the Terror forced Insight to recognize the immediate identity of Good and Evil in its dream of a return to the Earthly Paradise. The “thinghood” or objectivity of the Absolute was then recognized to be the intelligible “essence” of Moral Law (just as the “thinghood” or objectivity of the natural Understanding was Natural Law). The world of Utilities is the *instrument* (or the raw material) of Moral Reason. Unlike the Law of Nature, the Moral Law is *free*; it is the self-positing of Practical Reason.

But it is precisely the essence of this intelligible “absolute essentiality” to manifest itself. So while, on the one hand, the moral consciousness “lets the natural world go free out of the Self,” to be whatever it contingently must be, it is equally true, on the other hand, that it takes that contingent natural order back into itself. In the unity of conscientious *conviction*, this contradiction is successfully sublated. But the community in which Conscience finds itself, and for which it claims to act, is in a state of moral anarchy, which is only overcome by the transition to the religious community of universal forgiveness. That community, having returned to itself as the shape of religious faith, has only to recognize itself in the ultimate community of finite Spirit, from which its religious journey began. That ultimate community of Spirit was able to make the religious journey because, in the final sublation of the standpoint of moral judgment, it is reconciled with humanity at all times, and in all places. It does not need to judge, but only to comprehend, i.e. to integrate the *other* as a *member*.

Thus, when the community of Faith recognizes its own true “infinity” here, it comprehends what religious consciousness *is* as such, and what the function of *Vorstellung* is in that mode of consciousness. In this final form, the “Manifest Religion” ceases to be a “revealed” religion (in any but the historical sense) for it will comprehend that the whole range of religious “manifestation” belongs to it in principle, because its God is just the “intelligible force” of Reason, whose very essence it is to “manifest” itself. This concretely universal community of the human spirit is “the Self’s pure knowledge of itself.” “Conscience” is just its alienated, universally *self-assertive*, shape.¹⁴

- 6./793. The reconciliation of the ideal world of religious devotion with its actual world is built from these three elements. Conscience is the start because it contains the others; conscientious action is the beginning of the reconciliation of the two worlds. Action sets the stage for conscientious judgment; and all action must be condemned as selfish in some aspect. Forgiveness, as the pure knowing of this, which brings the singular and universal aspects together, and accepts the fact that judgment is as selfish as action, gives rise to the singular self as pure knowing or community.

These three moments that we have picked out of the finite career of Consciousness were not determined simply by the final structure of Manifest Religion. Only the first of them is given directly by that. The “death of God” is the “result” of the Manifest Religion; but it is just the beginning of the “Kingdom of the Spirit” and the moment into which that Kingdom returns. One can with some legitimacy say therefore that Hamlet musing upon Yorick’s skull is the determinate negation with which the mind of an “anthropological scientist” must begin when “faith” finally passes over into “knowledge.”

After that, however, the progression determines itself *logically*. We look over the course of the science and ask how “dead thinghood” evolves logically. First we go from “singular thinghood for self” to “universal thinghood for another”; and so to “the singular self that is lawgiver for the world of things.” And when we reach the third “shape,” we realize we have *not* passed over to Kojève’s “anthropology.” In

his world, the essential anarchy of Conscience takes us straight back to Hobbes. He does not need the "Religion" chapter at all except as a banishing of dialectical illusion. But for Hegel "Religion" is much *more* than that.¹⁵

These three moments of our scientific journey are the key to the conceptual reconciliation of Religion with actuality. These are the moments that contain the "actual" significance of the religious *Vorstellungen* for a fully "self-conscious" (i.e. *spiritual*) Sense, Perception and Understanding. The last of them, Conscience, necessarily contains the others in a sublated form. So that is where the movement of Absolute Knowing begins.

Hegel runs through the whole "experience" of Conscience for us again—driving home the fact that his seventh chapter circles back to where the sixth ended. It is the communal judgment of every would-be moral action that constitutes the "iron actuality" by which the active conscience is faced; the Hard Heart of the Community is what must "break." When Jesus prays for the forgiveness of those who crucify him, we must think not of his heart—which was only ever momentarily "hard"—but of the "Father" to whom he prays. It is no accident that, at the end of "Manifest Religion," Hegel inverts the Virgin Birth myth, and insists that the reconciled community knows "its *own doing and knowing*" as its "Father" (par. 787). The putting together of that knowing and doing leads logically to "heartbreak," because every judge must recognize the "sin" of sundering knowing from doing. Absolutely *pure* knowing becomes possible only in and through the act of "forgiving."

"Immediate *Dasein*" already has no other significance than that of "pure knowing" for the active Conscience. My conscientious conviction is that I have done the best I can in the circumstances as they are known to me; my "pure knowledge" is precisely that it is my *duty* to do that. We expect, in simple justice, to be forgiven for the errors caused by ignorance; the *Oedipus at Colonus* already makes this point quite clearly. Of course, in my uneasy "shifting" I do learn how "impure" my motives always are. But the forgiving community comprehends and forgives the fact that I saw the whole situation in *my* way, and defined my duty according to some personal interest that is not universally (or as Kant would say "categorically") imperative. Thus the community reduces "actuality" to the pure knowledge of what the inevitable conditions of acting are.

The "*determinate Dasein*" that arises from action and judgment in their "relationship" is the forgiving that comprehends the action in its concreteness. The acceptance of the action as "conscientious"—or as objectively rational—involves as its "*third moment*" the Spirit that says "Yes" (rather than "No," as the moral spirit must say). When the two sides are thus reconciled, the "universality" or "essence" in which both are comprehended is the "I=I" or "the Self's pure knowing of itself."

This "pure knowing," as a concrete experience, is necessarily both an achievement (for the two sides do indeed clasp hands in reconciliation) and an end or goal to be achieved (for we may spend a lifetime trying to comprehend the objective rationality of the other's act or judgment). *Experience* sets its limits too (as we must realize, if we read different interpretations of the work of the Magdalenian cave artists, to take the most striking boundary-instance that I can think of). But, in

principle, this is how the singular rational self—the recognized Conscience or justified sinner, *simul peccator et justus* in Luther's phrase—both constitutes the community, and is constituted by it.

- 7./794. Religion repeats this reconciliation process from the other side. In our Science the reconciliations happen separately. In the logical order of conscious evolution, the reconciliation of independent self-consciousness *must* come before that of its communal foundation (the *Ansich*). Now the union must be demonstrated; the *an sich* and *für sich* must be brought together.

Hegel is now going to bring the two shapes of reconciliation together (which I have been doing all along, so that this part of the discussion should by now be easy for us). In the Science of Experience the conceptual reconciliation of the finite consciousness had to come first, because it is the condition of our being able to comprehend what "Religion" is; and that finite reconciliation did already involve some aspects of Religion.¹⁶ If consciousness is to come to the comprehension of what "truth" is (or what the word signifies) through a process of self-criticism that we simply *observe*, then we must necessarily begin from the side of the "for-itself." The communal substance of our rationality is the "in-itself" which can only gradually come to be "for-itself"; and its last step must be later.

Religion is the complete shape of our cognitive experience, the shape in which the universal community of Nature and Spirit appears to itself as One Substance. In the order of historical experience the reconciliation (of the world of consciousness with social self-consciousness) happens first in Religion; and the full realization of the two reconciliations happens together, but with the conceptual reconciliation one step behind the consciousness that is achieved in Religion. It is, of course, the motion of "the Concept" as self-critical that drives both sides onward; but it is a mistake to identify the motion of the Concept with philosophy as speculation (or even as both speculation and critique) because the concrete historical movement of the real world—serfdom, political freedom, the Roman Empire, the Papacy, the Reformation, national monarchies, the Revolution—is so essential to it. The lesson that philosophy is not to be understood apart from its history is widely understood; what Hegel's science of experience teaches us is the much more demanding imperative that philosophy and religion must be comprehended together in the context of the actual history of the human community.

- 8./795. This union has already happened in manifest religion. But it appeared there as the voluntary self-manifesting of God in the worshipper's experience. Its proper form is the one it has from the side of the *für sich* (which presupposes the *an sich*). This is the side where the self-concept has already appeared as the beautiful soul. The beautiful soul is a vanishing moment because it declines to commit itself to realization, but it is the self-intuition of God; and its self-alienation is fulfilment (or the *community* of forgiveness)—the acceptance of "thisness."

All that remains now is to produce the last "shape of consciousness," the shape in which the religious community is reconciled with the world of actuality. It is

because this is now the problem that we have to turn back to the shapes of “actual” Reason and Spirit for our material; and the very fact that experience is now consciously turning back upon itself in search of the way forward is the sign that our journey is nearly over, our task nearly complete.¹⁷ In Religion we have seen the “absolute content” of Spirit (or *its* substantiality) expressed. We have now only to return to that contentless form (or subjectivity) of Spirit, which was our point of entry into Religion.

The evolution of Religion has brought us back to this portal already. So in principle, the equilibrium of Substance and Subject has already been established. But this reconciliation *an sich* is not in the proper “form,” the form of the communal self-consciousness that is *an und für sich*. Religion sets before us the *eternal* truth as what is “in itself.” Like Plato’s world of the Forms, it is “above”; it stands over against everything that we do, and remains unaffected by what happens in our “fallen” world. When the Risen Christ is recognized as “the Spirit” that descended at Pentecost, and both Pentecost and Resurrection are comprehended as a matter of now and everyday, this opposition of eternity and time, of the logical and the empirical, is implicitly sublated. But the sublation must be carried through logically.

The “shape” of Self-Consciousness in which God first appeared as Spirit was the penitently broken-hearted Beautiful Soul. This was the self-consciousness that avoided a bad conscience by avoiding action; its fully developed shape is the one seen in Hölderlin’s *Hyperion*. Hyperion acted conscientiously, only to find himself involved in sin and evil; and, in consequence, he withdrew from active life to become a spectator of all time and all existence. His world *now* is fallen and evil; only in the Greece of long ago do Beauty, Truth and Goodness still dwell. In Novalis, whom Hegel seems to have more directly in mind at the present moment, we find this “soul” not as a voluntary hermit, but as the leading member of a community that exists only as a fantasy in the book. This fantasy world need not perish (like its author) in consumption; it can move onward—as Hölderlin did, I think, in the *Empedocles* project. It can surrender the *determinateness* of its Concept (as Universal Judgment coupled with a *utopian* ideal in a book) and move towards its fulfilment in actual experience. The shape of the Beautiful Soul who did this was Jesus himself, who established a real community and then “went away” to a voluntary death, because it was “expedient” for them.

Thus, the historical Jesus (as imagined by Hegel in his essay on the “Spirit of Christianity”) is the singular *Gestalt* in whom actual subjectivity coincides with its religious “content.” But now we are not satisfied that this coincidence should happen only in *death*. The substantial content has to become the logical content—the necessary knowledge—of the universal subject who does not die to achieve universality, but lives to enjoy its “absolute knowledge.” And this knowledge is to be concrete; its “content” is the living recollection of the complete history of the community in which this absolute consciousness has finally become actively possible, i.e. possible as self-enjoyment, not only passively as self-sacrifice and suffering. The communal self of whom we are now speaking is ourselves. It is we who have

made the journey, endured the “patience and labor of the negative,” and who now constitute the self-enjoyment of the *Weltgeist*.

- 9./796. On one side self-consciousness was realized as the acting self; on the other truth has been expressed as religion. These two sides must now be united (negative thinking with positive thought). As selfish, the singular agent is evil. But *conscious* pure knowing is a mode of action that is self-absolving; it dies to know, and the substance dies to become its knowledge. In this way, the Divine Spirit emerges as knowledge. We must act in order to be knowers; but knowing is the sublation of action.

The concept (of self-conscious Absolute Knowing) fulfilled itself as “forgiveness” in the “self-certain spirit” that had no content except an *ideal* community; and it fulfilled itself as a *real* community in the historical evolution of Religion. But that real community depends for its unity on a projected image (*Vorstellung*) of its eternal destiny. The self-certainty of the broken-hearted Beautiful Soul must take the place of this *Vorstellung*. The real community must know “its *own doing* and *knowing*” as its “Father” in the way that the Beautiful Soul does. In this final confrontation it is the singular self who acts and the community that judges. The crucial moment of “forgiveness” belongs therefore to the community; but the absolute knowing belongs to the absolved individual, who thinks and knows at once for herself and for the reconciled community. It is the moral agent who steps out of the reconciled community in action; and it is she who has the knowledge of return and forgiveness. Everyone must recognize the reconciliation; but that communal recognition only preserves the community—it is not a knowing that is capable of further development.

In contrast, the “absolute knowing” towards which we are now moving is capable of development. It is the *experience* precisely of the philosopher.

Hegel regards the self-assertion of conscientious action as identical with the advent of “pure thought”—the thinking that can do Hegelian logic. The acting Self “carries through the life of the absolute Spirit. This shape is . . . that simple concept . . . The concept has its *sundering* or stepping-forth in the *purity* of the concept, for this purity is absolute abstraction or negativity [i.e. it is pure thinking].” This thinking by the moral agent is “negative thinking,” because it changes the world. But the “pure thinking” of the same self as an Hegelian logician is “positive thinking.” It does not negate any content. It changes nothing except the form of its own content; but the “content” we are speaking of is the whole history of Religion as manifestation, the whole history of actual spirit, and all of the experience of common sense and science that we traversed and organized in chapters I–V.

In other words, since the Hegelian logician must not be guilty of sundering herself from the self-consciousness of the community by a *moral* action, one can do logic only when one is in the most comprehensive possession of the “experience” of the community that one is able to achieve. Hegel’s *Logic* is not a “neo-Platonic fantasy.”¹⁸ Philosophical Logic is the attempt to think out the conceptual structure of the knowing that interprets the world of its own time scientifically. Hegel can only do Logic, because he already knows everything that it will be used to organize

in his "Real Philosophy." We have seen him rehearse all of this "experience" in his critical approach to the "absolute knowing" that is the "element" of Logic.

"Pure (logical) knowing" is the self-knowing of the reconciled Conscience that is self-consciously at one with its community, and incarnates its "Spirit." In its practical aspect this knowing is "evil" because it *does not act* and *is not actual*. But Hegel's repetition of the reconciliation of the Concept's two sides in their mutual recognition now has the object of turning Religion into "knowledge" not as the "knowledge of good and evil" but as the absolute knowledge of "what is." In this cognitive reconciliation each side has to recognize itself as "evil for itself and good in itself." Both will therefore be "in and for itself" the reconciled identity of good and evil, i.e., the "pure Concept" in which evil is accepted as a dialectically necessary moment of the affirmation of the good. The human good is *knowledge*, and it involves the recognition of selfishness as evil; but it involves also the recognition that only the self can have "knowledge."

Pure knowing is neither judging, nor acting; it involves the letting go (*Ablassen*) of both "determinacies" of the Concept (the active subjectivity of the agent, and the substantial Objectivity of the community). Thus pure knowing is a kind of return to the paradisaical state of "innocence." But we can speedily disabuse ourselves of the idea that there is anything particularly remarkable about it, by reflecting that we ourselves achieved it fairly easily and without much conscious strain, in adopting the posture of speculative *observers* of consciousness. The Absolute has been with us from the start, in the form of our knowledge of what our own proper position is, and what our behavior as observers should be. We have been "neutral"; and now the systematic philosopher must be neutral, with all that we have observed at her disposal. She needs it all in order to have the saving consciousness of being "good *an sich*"; and unless she has all that we have, the communal *Vorstellung* will still be essential.

The Beautiful Soul is the hero of this last movement of Spirit, because its moral *act* is the withdrawal into Self as a pure observer. It is the antithesis of the self-actualizing *Begriff*, because it does not act, and is not actual. It participates in the antithesis; and in so far as it is independent knowledge of the Concept as pure essence, it is self-assertive and "evil." But, in that it has become the simple knowing (observing) of the essence, the knowing that has received forgiveness, and gives it back freely to everything that it observes, it remains "good." It lets the Concept go through the very same motion as Substance, or as the absolute essence. The doubling that occurs in this state of free release lets the Concept be "in and for itself." In this pure knowing, the one-sidedness of self-assertion and the one-sidedness of simple being are both renounced. Self-Consciousness renounces itself just as the absolute essence does in the *Vorstellung*; but now it is knowingly renouncing its own concept (as self-assertive) just as the absolute essence does. Thus the "beginning" is *mediated* by self-negation on both sides. Each has the definition of "self-negation" for the other, and the negation is a double one, or is self-sublating into a higher unity.

The point is that the Spirit is what it makes itself to be, and "absolute Spirit" is

the unity of the knowing self with its world. On the side of the knowing self there is an “inequality” consisting of its self-containment [*Insichsein*] within its singularity *vis à vis* the Universality; on the side of the religious content (or Universality) there is the “inequality of its abstractness *vis à vis* the Self.” Each side *negates itself* (or “dies”) *for* the other. The movement is the same as in forgiveness, but we should not call it that, because it is more radical. The sides die for each other, exactly as Man and God “die” for each other in the religious *Vorstellung*. What is crucially *identical* in both movements is that they begin with a self-conscious act. But the act of self-conscious thinking needs no absolution from the other side; it absolves itself by knowing that as the act of knowing it is good in itself; and as the act of knowing it is the act of self-negation, of “dying” for the content known. The community’s religious knowledge, on the other side, “dies to its unliving Self and its unmoved Universality.” This refers to its descent from the *abstract* eternity of Heaven and the old logic. “Through this movement of action the Spirit . . . has come on the scene as pure universality of knowing that is self-consciousness, or as self-consciousness that is simple unity of knowing.”

- 10./797. Thus by simply gathering the moments we have shown that God’s manifestation is the same as our activity in knowing our own world. We only had to collect the moments (each of which exhibits Spirit as a whole) properly; and to insist on the maintenance of conceptual form.

The task of philosophy, as Hegel understood it, was to interpret the *actual* world of experience; the philosopher is supposed only to organize what is there logically. Religion is the proper object of philosophy, because it is the way in which the community “is there” for itself in its world. The philosopher’s task is to exhibit the rationality of the way that the community presents itself to itself in its world. What shows that the community is now presenting itself to itself rationally—what shows that its Religion has become obsolete as *Vorstellung*—is precisely the fact that a would-be philosopher with the formal concept of her task stated in the first sentence of this paragraph has come to the philosophical consciousness of what “Religion” actually is.

In the *Vorstellung* of the Manifest Religion God graciously gives us the knowledge of what He is; He reveals Himself as Creator and Preserver, and as the Spirit that knows Himself, by sacrificing Himself to death. All this has now become the act of the rational self-consciousness. The knowing self has the absolute knowledge of being “the activity in all essentiality and all *Dasein*.” It is “the knowing of *this subject* as the *Substance*, and of the Substance as this knowing of its doing.” In order to show this, all that we had to do was to put together the right conceptual moments, and to insist on the conceptual form of expression.

I believe I have successfully shown how and why we are led by the *Vorstellung* of the Manifest Religion to pick out the three moments that Hegel does pick out in order to make this final transition; and how they express the “totality” of the Spirit. Whether the complete *Versammlung* of the moments for the Science of Experience is logically adequate the reader must decide; my task has been only to exhibit the

“logic” of it as well as I could. The one advantage I claim to have had over previous students is a clear understanding of why the period from Augustus to Napoleon represents the “logical cycle” of experience, and why it has to be traversed several times. This I hope by now to have made clear; for it is only when we know what actual world is being interpreted that we can assess the “logic” of the interpretation. That the logic is perfect I would not myself pretend. But I claim that when it is properly understood it is far better than most previous interpreters have thought (and far more adequately concrete and historical than those who did believe in it have ever managed to show).

I find nothing further to explicate in what Hegel says about “the knowing of the doing of the Self within itself as all essentiality and all *Dasein*.” As soon as we read it in its *spiritual* sense it is obvious. The human community lives in the world of its own interpretation, and this decides even what counts as “fact” (*Dasein*) for it. “This Subject” knows itself as the Substance when it does Hegelian logic, for then it is self-abandoned to the *Sache selbst*; and the Substance is “this knowing of its doing” when the *Sache selbst* achieves its philosophical apotheosis as “the actual cognizing of what truly is” (par. 73).

The mode of speech may seem strange—I find it so myself. But we should notice how *existential* it is. It is the self-knowledge of “this subject” that is said to be “what truly is.” One could not imagine a more emphatic affirmation of the Christian view that God loves every one of us; and that every human person is therefore of *infinite* value, as the free self-determining of Reason, the Incarnation of the Logos. Anyone who recognizes the answer given here to the problem of philosophy as posed in the first sentence of the Introduction must know with categorical certainty that all of the “totalitarian” interpretations of Hegel’s social philosophy are radically mistaken. We do not (cannot) live simply in accordance with “duty.” We define ourselves in our own way (and we must be “forgiven” for this necessary self-assertion). Hegel himself lived in a finitely actual world in which there were many forms of authority that are plainly no longer “rational” for us; and because of the Terror, Hegel may have thought some of them were more nearly “absolute” than we have found them to be. But that only represents a “progress” on our part within the “infinite” community that he recognized.¹⁹

(c) *Science as Self-Comprehension*

- 11./798. This last shape of Absolute Spirit is *comprehending* knowledge. The truth of religion has now achieved self-conscious certainty. Spirit has appeared as *Science*.

This philosophical consciousness that the knowledge-seeking Self is the world’s own necessary process of self-interpretation is the last *Gestalt* of Consciousness in the Science of its “experience.”²⁰ It is a “shape of Spirit” because the philosopher is a singular consciousness who must think neutrally for the human community. She must have “died” for the *Sache selbst* of *comprehensive knowing*. The religious consciousness of “Christ risen in me now and here” has the same knowledge. But

that is still the knowledge of an “other”; it is not a truth that is identical with self-certainty. Josiah Royce expressed the religious view philosophically when he claimed that “We are saved by the Community.” But absolute knowing is implicit here, because the “saving” community arises through the mediation of the conscientious individual. Royce did not foresee the totalitarian communities (for whose excesses no rational critic would blame him). But *we* have seen clearly that the actual community that sustains us as our *real* “substance” can just as easily be the cause of damnation as of salvation.

One might be tempted to argue that there is no real difference between the religious view and that of philosophy, because no individual thinker is perfect, and there is a strain involved in the achievement of scientific “neutrality.” But to see this identity is also to see the crucial difference. To be “self-certain,” to be free even of the *Vorstellung* of the Savior, is to be able to *think* freely, and without impediment. As philosophers, we must leave the *Vorstellungen* of Religion behind, because there is no going beyond them in their own terms; and yet we know that there is still much work to be done. We have arrived at the “element” of Science, but we have still to produce the scientific interpretation of our world. So far, we have only produced a scientific demonstration of what Science is. And it is only because we have arrived at *this* knowledge that we can now see and say why it is a “scientific” demonstration.

- 12./799. As a result of the whole progression, *this* single knowing self has become identical with Absolute Spirit (I/We). It has a distinct content, which is the logical *movement* of self-sublation, that it subjectively is. It is Absolute Spirit because it has the shape of the concept in its objectivity.

Philosophical knowledge is the “pure *Being-for-Self* of Self-Consciousness.” “All men,” said Aristotle, “naturally desire to know.” The primitive Self-Consciousness which knows nothing except that it is *free*, *desires* “another Self-Consciousness” as its ultimate object (par. 175). In my interpretation of that Desire I argued that it makes sense only as the desire for self-knowledge, the desire for a self that knows its world, and itself in its world. That interpretation was confirmed by Hegel’s claim that the “concept of Spirit” had come before us (par. 177). At the present juncture we must underline the fact that philosophical Being-for-Self is the last shape of Spirit. The Self-Consciousness whose Being-for-Self it is, is Aristotle’s “all men,” or the human community. As Hegel insists, it is “an ego which is *this* one and no other ego.” But at the same time it is the absolute “We,” or the “sublated *universal* Ego.”

“It has a *content* which it *distinguishes* from itself.” But this content is the whole human world of which this philosophical self is the “Spirit”; so “the content even in its distinction is the ego.” The content is that “absolute otherness” (the “otherness” of God or the world, the *absolute* object of consciousness) in which the philosophic self *recognizes* itself as “We” (pars. 26, 177). In the Preface Hegel called this “absolute otherness” “Aether”; here he calls it “pure negativity.” Clearly he means “pure thinking,” the element of Logic, but it is not “pure” in any Cartesian or Kantian

sense. The whole of human experience is sublated in it; and that means that all of experience is here *preserved*, that it is available to recollection at any and every moment. For the moment I have only the methodical character of our progress to confirm this claim, but we shall see that Hegel himself confirms it explicitly when he closes his Science of Experience into its own speculative circle at the very end (par. 808). The difference between the “Aether” of “absolute knowing,” and the “dark night” of “formalism” is the abyss that lies between a logic of abstraction which requires “forgetting,” and a logic of “knowing” which requires “recollection.”

The explicit content of this Absolute Knowing, however, is simply the structure of the *movement* of this concrete pure thinking. This motion is the Spirit that unites the thinker with the world of human experience, making both of them “human” in the proper sense. The “shape” of the Concept in its objectivity is God as incarnate in the human community. The pure thinking of the logical philosopher is that same “shape” in its sundered *being-for-self*. The task of systematic philosophy is to exhibit this identity by moving from the pure subjectivity that has here been achieved, back to the developed form of the “Concept in its objectivity.” At this moment what we “absolutely know” as the Ego that we *are*, is precisely the “movement” that is expounded at the climax of the Logic. We are standing at the midpoint between Logic and Real Philosophy.²¹

- 13./800. This concept of Science could not appear earlier in time, because Spirit had to reach this consciousness of itself first. In particular we had to conceive God as Spirit. The religious consciousness had to be mature. The “substantial” cultures could not achieve “absolute knowing.”

Science, as the self-conscious movement of this objective Concept, logically could not come to “be there” as an object of consciousness until the fully concrete concept of the Spirit had fulfilled itself in history. Hegel recognizes the first dawning of the philosophical concept of “Reason” in Anaxagoras’ doctrine (par. 55) of the cosmic Nous (which is present in all living things, and can be *recognized* by those living things that can *think*). Plato’s Ideas were the beginning of Hegel’s conception of Logic. But the *Gegensatz* of objectivity and subjectivity, or of eternity and time, is absolute in Plato. It was Aristotle’s concept of Nature as a system of self-actualizing “Forms” that began the sublation of that antithesis. At the level of “Spirit” Plato’s doctrines of Recollection and of the “kinship” between the Soul and the Ideas, are self-estranged shapes of Hegel’s phenomenological *Erinnerung* and of the Incarnation respectively.

But without “the belief of the World”—which had learned to use Plato by the time that it “appeared”—the reconciliation of Self-Consciousness with the objective consciousness of the Platonic “Understanding” could never have come to pass. Hegel’s main story flows from Anaxagoras and Sophocles (who were almost exact contemporaries) to the writing of his own book. But in the evolution of Religion he has to go back to Zoroaster in order both to encompass the contribution of the invisible God of Abraham, and to make clear the speculative significance of Greek Art (and especially of Sophocles). There is no doubt that the Greek experience (of

the Ethical *Substance*) taken up into “the belief of the world” forms the driving power of the Spirit as Hegel understands it. Christianity contributed the principle of “infinite subjectivity,” the principle that the singular self-consciousness, every singular self-consciousness, is just as absolute in value as the “Substance” itself.

As Hegel said in the *Real Philosophy* of 1805, “This is the higher principle of the modern time, that the Ancients, even Plato, did not know.” When he says here that “Substance . . . is not in itself absolute knowing” we should remember the *Eumenides* in which the “absolute knowledge” of the Ethical Substance is expressed through the *Vorstellung* of a speaking Goddess; and then Antigone and Creon tearing Athena’s wisdom in two in their tug of war; and finally Plato, the philosophical Creon, proposing to abolish the family for his ideal City.²²

- 14./801. The knowing substance (the community) has to be there first before it can be the self as subject. It has first an imaginative consciousness; and subjective self-consciousness remains much poorer than this, being always just one moment in a cycle. But in the progress of this cycle it takes over the whole content. So self-consciousness finally *arrives* at the whole with which its consciousness begins. Time is the mode of being for this cycle, and the concept is in time until it comprehends itself completely. Until then time is the river that carries everything away, in order that self-consciousness may enrich itself.

The appearance of the “belief of the World” is the first moment of the “knowing Substance.” This is also the beginning of “the world of Spirit in Self-Estrangement.” That world sees itself as an opposition of two worlds; but we should remember that Hegel calls it a “*doubled world*” and speaks of it always in the singular. This is because it expresses the internal “antithesis” of the Concept; more concretely, it knows *itself* in the *Vorstellung* of the “other world.” All of its knowing is Faith. It has the form of *Vorstellung* in the mode of sensible “immediacy” and “simplicity”; and the singular consciousness of life in this world is “unhappy.”

By the *wissende Substanz* Hegel means the Christian world of the Empire and the Papacy; and its conceptual cognition—in which the knowing self and its objective world must be equal—is, to begin with, very “poor.” Its simple consciousness of God (“the Substance”) in Faith is “much richer.” But the manifestation or revelation of all this truth is actually a concealment, because all of the objective being in the actual world is “selfless.” Reason (although it is the Substance) has only the certainty of being a *pure* Self in this world; its Substance is hidden or “buried” in its Faith. So at first only the “abstract moments” of the Substance belong to Self-Consciousness. These “moments” are to be found (first of all) in the thoughts of the Trinity in Faith; but it was the abstract thoughts of “Good” and “Evil” that appeared before our observing eye, and drove themselves forward until self-consciousness had wrested the whole Substance out of consciousness. The *manifest* world of Faith is really all hidden or buried in the “mind of God”; and “God” is a “substance” (not yet a “self” for whom things are *useful*). The humanism of the Deists and Materialists “sucks in the whole structure of the essentialities of the divine Substance”; Insight brings *Heaven* (the hidden world, manifested only to

Faith) down to Earth. This “movement” of finite Reason must now be seen in the context of the movement of the Trinity-Concept in the Manifest Religion. I am not sure how this can best be done, so I shall leave it as a programmatic requirement (just as Hegel does here).

At the stage of Enlightenment, Self-Consciousness (as Pure Insight) has a firm grip on the “abstract moments” of Substance. It cannot find itself in the world as anything more than a dead skull; and the order of Nature is a great system of *Utility*; but through the evolution of the Moral World-View, Self-Consciousness becomes the real *Begriff*. The emergence of the absolute Self-Concept, presupposes the parallel development of the Critical Philosophy of finitude and of the Manifest Religion, until they come together in the self-consciousness of the broken-hearted Beautiful Soul. The “presupposition” is *historical*; until the moment of convergence, the “whole Spirit” is moving forward in time.

Reason has the intuitive certainty of “being all reality” from the first (Anaxagoras, Plato, Aristotle, Bacon, Descartes). Enlightenment is its *Gegensatz*, Reason’s own condition of alienation. In the rebirth of speculation that begins with Schelling’s Identity Philosophy (pars. 14, 17) “the Concept knows itself as Concept.” The *Phenomenology* itself is the completion of this speculative revolution. It is a revolutionary work, and we can see by what happens to the Enlightened concepts and the *Vorstellungen* of “Manifest Religion” when they are united, that it completes the revolution almost alone. Only the Romantic creators of the Beautiful Soul literature contribute positively to the final movement from the “estrangement” of Judgment to the syllogistic mediation of purely conceptual knowledge; and Hegel, as the author of the unpublished “Spirit of Christianity,” himself provided the portrait of Jesus as the Beautiful Soul in whom the *Vorstellung* and the *Begriff* finally coincide.

Of course, Kant’s discovery of the *Triplicität* in the structure of the categories—his triads of what *Fichte* called “Thesis, Antithesis and Synthesis”—was an absolutely vital step in the emergence of Hegel’s “Concept” as a formal logical entity. But as Hegel says (par. 50) that was a discovery made by *instinctive* Reason. So he quite rightly expounds it as “the self-certainty of Reason”—which is a revolutionary force in the world of “estrangement,” but is itself “estranged.”

All of these moments (including Hegel’s own “Jesus”) had to “be there” in the record of our culture, for Hegel to “recollect” and put them together into the *Begriffsgestalt* of Absolute Knowing, or the Substance that is Subject. He says modestly that “the share in the collected work of the Spirit that falls to the activity of the single [individual] can only be tiny” (par. 72). But he is well aware that the one stone that he has put in place is the coping stone of a great arch between the ideal of natural courage, and the ideal of spiritual charity. That arch took more than two thousand years to build; and to be able to see it at all was a truly remarkable feat of “Insight.”

Hegel’s own comments on “time” bring the magnitude of his achievement home to us; and they also show that he appreciated clearly what his own achievement consisted in. Time, he says, is “the *Dasein* of the *Begriff*.”²³ It is the way in

which the Concept—the incarnate unity of God and Man in the Community—is simply *there* as an immediate “object of experience” (a “fact of consciousness,” as the philosophers of his time said). “The Absolute was with us” at the beginning when we said “Now is Night” (par. 95). But that concretely transient Now was the Absolute as pure negativity. In this negative sense, “Now” is “what is by not being.” The time in which the Spirit appears is a time in which the “real” negativity has been negated through idealization by the Understanding. It is not the transient Now, but the forever fixed and unchangeable expanse of the “Then,” which is preserved in the “eternal Now” of recollection (while the simple Now continues to perish). In the seemingly inexhaustible variety of the recollected Then, the shape of the Spirit in its *positive Dasein* must be picked out. It must be *resurrected*, recollected as the infinite “living thing” of which our presently sensible world is the sensible “property.” That “Substance” is the outwardly intuitable shape of the “pure Self.” When we have it complete before us we can first *cancel* (*tilgen*) time (as we do in the imagined “eternity” of Religion and in the logic of the Understanding) and then *sublate* it properly, by comprehending it and “eternity” together as the *Gegensatz*, the opposed moments, of the self-knowing Concept that is the “true Infinite.”

Until we reach that comprehensive perspective, that “absolute knowing” of the Concept, “time” must appear to us—as it does in the *Vorstellung* of Religion, or the abstract conception of the Understanding—to be the (religious) “fate” or the (understandable) “necessity” of the Spirit. It is a “bad infinite” in which only mortality and change is visible; we yearn toward an “eternity” that is altogether “beyond” it (or even more absurdly, towards a Utopia that is supposed to be at the “end” of it). If we are to “comprehend” time we must comprehend the recollection of the understandable past in the present. Then we shall be able to grasp how the negative, vanishing Now, and the positive, eternal Now are comprehended each in the other. Hegel is now marching steadily towards this final insight with which the “Science of Experience” will close upon itself as a speculative circle.

- 15./802. Thus it is true that only what is felt to be *true is known*—i.e., experienced as an inner revelation. Experience is the motion of the spirit as substance coming to itself as self-consciousness (the only form in which it truly is spirit). This movement is a circle that closes back upon its beginning. At the beginning the intuition of the whole divides into concept (time) and content (Being). The content must be displayed moment by moment in time, before spirit can be its absolute self as comprehension. So the historic evolution of religion comes first.

Time in its endlessness—or as it is formally conceived and preserved by the Understanding—is the medium (or the element) of *experience*; so the Science of Experience is the “comprehending of time.” This Science is necessary (and it is necessarily the *first* science) because whatever is to be “known” (that is to say, philosophically comprehended) must first be experienced as an “object of consciousness.”²⁴

The “experience” of philosophical truths is always in the mode of *abstract eternity*. As we can see from the examples of Phrenology and Utility, the conceptual experience of the Understanding is just as crucial as the religious conviction

expressed in an eternal *Vorstellung*. But it is “self-estranged”; and for that reason it cannot be absolute. The experience of the truth in Religion can be, and ultimately is, “absolute” in every respect except that it is a form of “consciousness.” It does not have the philosophical form of “absolute *self*-consciousness.” Hegel is faithful to his existential principle of subjectivity (as well as to his methodological principle of continuity) when he insists on the religious form of truth as the ultimately comprehensive mode of “experience.”²⁵

Hegel speaks now for the first time of the necessary closure of the Science of Experience. Through the transformation of the “absolute object” of (religious) Consciousness into the object of Self-Consciousness (the substantial Self of the human community), the circle of experience closes. This closure entails the elimination of all radical transcendence. Nothing “beyond,” nothing outside of the circle can break in. We might express Hegel’s concept of Spirit by saying that “To be *potentially* is to be interpretable conceptually as an element in human experience, and to be *actually* is to be successfully so interpreted.” Christianity is the “absolute” religion, because it makes “God” conceptually interpretable without residue; and what is more it makes that self-absolution of its absolute object *necessary*.

The moments that have finally to be reconciled, in order to close the circle of experience into a scientific (or conceptual) circle are the initial “intuition” of the “pure Concept” (or time as absolute negativity, the self-sublating Now) and the final comprehensive intuition of the “content” (the biography of God as Spirit, the *Phenomenology of Spirit* as a whole). The intuiting Self is always and necessarily aware of itself as the first term; but it could not become the “scientific” (or logically comprehensive) Self-Consciousness, until the *Weltgeist* itself reached the objective shape of self-conscious Spirit in the Manifest Religion. (By this time we have said quite enough about that.)

- 16./803. Actual history is the labor of self-display. The religious communion as Substance [i.e. the Roman Church] is *raw consciousness*. Only when the hope of an alien overcoming of alienation was given up [the Reformation] did the turn inwards begin (along with the revaluation of this present experiential world). This was the first step in the descent from Heaven. Scientific observation came next, finding *Dasein* as thought [Descartes]. Now the Light-Essence [par. 686] could be grasped more rationally as unity of being and extension [Spinoza]. The rational spirit was appalled and asserted the claims of individuality [Leibniz]. But culture alienated this individuality, and achieved the utilitarian outlook [pars. 580–581, 584] and absolute freedom. Only then could it turn inward and become Fichtean [par. 657]. Now it has reached the form for which “time” offers the content. Instead of Thought = Extension [Spinoza] we have Thought = Time [Hegel]. In between comes the Identity Philosophy through which [Spinoza’s] Substance was comprehended—but only as the blackness of all cows in the night, except for details randomly rescued for interpretation.

The *Weltgeist* is the Spirit as incarnated in the history of what the conquering Romans called “the world of homes” (*oikoumene*). This is the world which had inherited the Greek concept of *polis* and *oikos* (city and household), before the Gospel came. Thus the Science of Experience is properly the speculative philoso-

phy of history as applied to and perfectly exemplified in the history of Western Europe as one self-constituted, and self-conscious (i.e. universally recognized) community. Seen thus, in its *proper* perspective, the *Phenomenology of Spirit* is a far more interesting essay in the speculative philosophy of history, than the *Philosophy of World History* as conceived and executed at Berlin in the context of Hegel's mature system.

In the System it becomes the assigned project of the philosophy of history to show that the "freedom" which Kant took to be the regulative ideal of history, is *actual* in history; and the theological form of the self-knowledge of the *Weltgeist* as Substance, is a logically unavoidable starting point. For this reason, it becomes disastrously easy to overlook the fact that this theological form is precisely what is sublated in history by the actualization of "freedom." In the *Phenomenology*, because we begin from immediate (and hence subjective) experience, we are logically obliged to find out what words like "God" and "Providence" really mean, before we are allowed to use them at all. The *Phenomenology* shows us what the *Weltgeist* is; the *Philosophy of World History* appears to take it for granted that we already *know* that.

Actually the intention of the *Philosophy of World History* is that we should find out as we go. We begin with the *Vorstellung* of "Providence" because we are all presumed to share it and to believe in it. But we children of the scientific Enlightenment are not accustomed to learn from books (or even from "experience") in that primitively "natural" way. Difficult as its transitions are, the *Phenomenology* at least presents us with the problem in what is for us the appropriate perspective of a "scientific investigation." And although we may cease to take the programme seriously because we cannot make the transitions, at least we are hardly tempted to think that we understand the Science of Experience while we still have everything backwards. That is the *natural* temptation when we read the introductory part of the *World History* lectures.

In this Western Roman world—for although *Constantine* is crucially important to Hegel, *Constantinople* only becomes important when it "falls"—the Christian "commune"²⁶ is the "raw" consciousness of the barbarian hordes that first took over the Imperial authority, and then let it lapse. In that situation, it was the Church itself that became "all the harsher and more barbarous, the deeper its Spirit is."²⁷ This is the time when the authoritarian spirit triumphs in religion. The estrangement from God in Heaven is to be sublated in an "external, i.e. an estranged way." This "hope" is only given up in the Reformation, after the failure of the Crusades. The Lutheran interpretation of Paul's doctrine that "Christ lives" in every saved consciousness is "the return into self-consciousness."

Absolute Knowing has its "phenomenology" in the history of *philosophy*. This is the logical "return" of finite Reason into the phenomenology of the Infinite in Religion. Hegel shows himself to be far more conscious of the Scientific Revolution than he is of the Renaissance. This is because the Reformation has such crucial importance in his mind. According to his analysis, the scientific revolution presupposes the Reformation. This is an oversimplification, for he was demonstrably con-

scious of the importance of Galileo's work, and he recognizes Descartes as the philosophical pioneer of "Reason." But, if challenged, he could point to Galileo's difficulties with the unreformed Church, and the evident fears aroused in Descartes by the news of Galileo's trial.

What he says here about "Observing Reason" (*die Beobachtung*) points first to scientific rationalism generally ("it finds *das Dasein* as thought") and then to Descartes specifically ("and conversely it finds *das Dasein* in its thinking"). Rational Observation is "conceptual comprehension" both of "*Dasein* as thought" and of "thinking as *Dasein*." But the whole revolution takes place in the world of "estrangement"; and Enlightened Utilitarianism is a decisive falling away from the speculative achievement of the "Cartesian metaphysics" (par. 578). Descartes, Malebranche, Spinoza, and Leibniz all know themselves "in God," and regard rational theology as the necessary logical context of human rationality. The empiricists, and the scientists who operated in the thought-context that they provided, were only "instinctively" rational. The dualism of Descartes, and the postulational theory of Kant, are the logical development of "estrangement" in this instinctive mode of Reason. Extended body becomes the instrumental material for the externally teleological activity of mind (or "thought"). So we should understand "Reason's Certainty" as an *intuitive* kind of "conceptual comprehension"; it needed to lose itself, and become self-alienated in its *Gegensatz* (Bacon, Locke and the utilitarian common sense of the Enlightenment) in order to "return to itself" in German speculative thought (*instinctive* in Kant, and increasingly self-conscious in Fichte, Jacobi, Herder, Schelling and Hegel).

Hegel moves from Descartes to Spinoza thus:

In virtue of having thus next expressed the immediate *unity* of thinking *and being*, of the abstract essence and the self, itself abstractly, and of having awakened the first Light-Essence *more purely*, viz. as the unity of extension and [thinking] being—for extension is the simplicity that is more nearly equal to pure thinking than light is—so that it has awakened again in thought the *substance* of the sunrise . . .

If I am construing this awkwardly complex sentence correctly so far, then Hegel regards Spinoza's "geometric" reformulation of the Cartesian metaphysics as the abstractly universal expression of the "immediate" unity of thinking and being asserted in the *Cogito*. It is clear, in any case, that he regards Spinozism as the return of the Light-Essence of natural religion at the level of rational consciousness.²⁸ Thus my contention that "manifest Religion" must reincorporate all of the earlier phases of its development is confirmed, because this is what has happened during the emergence of philosophical Reason. That Spinoza's rationalism itself is stigmatized as "abstract" confirms further that the reincorporation of natural religion has to involve spiritual reconciliation (for that is what the "concreteness" of experience involves). Hegel expects that the religion of the dawning culture will be Wordsworthian in its attitude to Nature.

The horrified reaction of orthodoxy to Spinoza's "God-intoxication" (as Novalis

called it)²⁹ is expressed by Leibniz. The Leibnizian concept of the rational monad is the “affirmation of individuality” against the “abstract unity” and the “*selfless Substantiality*” of Spinoza’s God. The monad is a completely self-contained subject (and hence an “individual substance”). But the doctrine of universal mirroring enables Leibniz to maintain that all of the monads subsist logically “in God”; Leibniz is therefore probably the most adequate paradigm of the *speculative* “Certainty and truth of Reason.”³⁰

When “Culture” establishes the Absolute Monarchy verbally, and the older nobility of *service* gives place to the *flattery* of the courtiers, this principle of “individuality” is *entäussert* (emptied out). The Leibnizian substantial monad (the “immortal soul” of theology) becomes the finite bourgeois self. It spreads out over the whole range of the external world of material property, and the gospel of salvation becomes the gospel of “universal utility.” Then, in the “absolute freedom” of the Revolution, the spirit grasps *Dasein* as its “will.”

Bildung is originally the reformation of the human self in accordance with God’s plan of salvation. But in *Candide*’s doctrine that we should “cultivate our gardens” we can see how it has inverted itself. We can recognize the transition from theological rationalism to matter of fact empiricism as the “alienation of individuality in culture, through which it is made into *Dasein*.” At this point, *Dasein* is the “matter of fact” that no longer refers us to a real essence, because all “essences” are presumed to be nominal. The Revolution seeks to make the Rights of Man and Citizen into simple matters of recognized empirical fact, as if society itself had no spiritual essence, and as if social recognition itself was not a recognition of essence. This empirical recognition is what is secured by force; so the Terror realizes the Hobbesian philosophy in which that nominalism was systematically formulated.

Only after this self-alienation of Reason can it return to itself and enter into full self-possession. In the Revolution, Spirit “turns the thought of its inmost depth to the outside, and expresses the essence as ‘ego = ego.’” But essential being is a reflection back to inwardness; and that is what is produced by the Terror. So now we have the critical idealism of Kant and Fichte. Fichte’s “Ich = Ich” is the motto for “Reason’s Certainty” because Fichte makes the implicit essence of Reason explicit. But what Hegel says about Kant’s “formalism” in the Preface applies to Fichte’s idealism as expressed in his “turning of the inside outwards.” It is still “dead and uncomprehended” (par. 50). Fichte thinks that the identity of inner and outer is immediate, and can be expressed in an abstract Utopian vision. To express his own relation to Fichte, Hegel has to insist that the whole historical movement of the *Phenomenology* must be inserted in place of the immediacy of the equality sign. “As pure and at the same time objective for the self-knowing Self, this pure difference [between self as subject and self as object] has to be expressed as *time*.” His own conception of Absolute Knowing has the motion of “reflection into self” as both its “subject” and its “object.”

The “difference” between “this” self and its absolute object is “expressed as *Time*” in the first chapter of the book; and we have finally comprehended the “difference” by recollecting the experience of more than two thousand years. The

problem of the Hegelian philosophy is not the “unity of thinking and extension” as conceived by Spinoza, but the “unity of thinking and time”.

Recollected time is “the distinction left over for itself” as “the objective rest of *extension*.” The reduction of time to a kind of extension (which we all perform with our appointment books and diaries) is the first step in its comprehension. Our critique of Sense-Certainty began with the recording of “Now is Night,” and the recollection of it at midday. The preservation of what is “restless and unhalting” in a state of “objective rest” is what the Self is as an *identity*, so this sublation of time is what we have to be self-conscious about. We are able to *spatialize* time in this way, because there is a spatial world that “abides” for us in time; and that is why the Leibnizian monad can “alienate itself” into a finite *Dasein*.³¹

But when we *externalize* the self in this way, we are led to accept the abiding immediacy of things in space as our model of substantial being. Everything that changes, becomes a mere *accident*; and that means that the “absolute knowing” (of the Subject as Substance) becomes the knowing of a bare identity. Like the finite self in Sense-Certainty, the absolute self that is “beyond time” can know *nothing* except that “It is.” Schelling was badly mistaken when he tried to found the theory of absolute selfhood on Spinoza’s identity of Thought and Extension. The *motion* of temporal consciousness, as a reflection upon itself as “being,” is the essence of its *life*.

When we shift from Spinoza’s problem to Hegel’s it is the nature of “logical eternity” (of which Spinoza, with his mathematical approach, thought we all had a perfectly intuitive knowledge) that becomes the focus of concern. The “eternity” of logical validity is guaranteed for Hegel by the successful closure of a circular movement in recollection. It is properly the conclusion of a “syllogism” rather than the absolute premiss of all syllogizing.

Only when the great circle of experience has been completed and comprehended in recollection is the “complete and immediate unity” of the Self as subject with the Self as Substance established. At the beginning of the *Phenomenology* what we are “certain” of is a mere “accident” of Substance; at the next instant we are certain that it *was* just an accident. Otherwise we have only the empty intuition that “It is” (meaning the nameless Substance that cannot be characterized). This is just the situation of the worshipper of the Light-Essence; and by applying this model properly to Spinoza’s Substance we can arrive at the *Urwahre* of Reinhold. This is the “Abyss” of the Absolute as a dark night in which all the cows are black.

Kant has taught us to recognize Spinoza’s error (the assumption that the categories of reflective Understanding—and especially “causality”—can apply to any such “Absolute”). So when the formalists of “Schelling’s school” do their “philosophy of Nature,” we can recognize at once that they are only picking up their supposedly rational “content” from sense-perception, like Zoroaster and his followers.³²

The last sentence of paragraph 803 strikes at the Identity Philosophy in all of its forms. It is as much a criticism of Hölderlin and Schelling as of Reinhold, and Schelling’s epigones for whom Hegel felt such bitter contempt. “Knowledge would seem to have come by things, by the distinction from itself, and the distinction of a

manifold of things, without anyone being able to comprehend how and from what source.” This expresses the discomfort Hegel had felt throughout the Jena period about Schelling’s “intuitive” approach to the Absolute; and certainly the *Phenomenology* makes a heroic attempt to do justice to the whole world of “difference.”³³

- 17./804. Spirit is this movement that is the structure of consciousness as subject and object, each advancing towards its own supersession. To begin with, the self is submerged in the social substance. But self-consciousness withdraws into independence and is *there*. This free self must go down again into the communal continuum fearlessly, emptying itself out in order to express its being-for-self. This is not a drowning of self among the black cows, for self-knowledge grasps the whole.

Hegel’s most important debt to the Identity Philosophy is his debt to Hölderlin. His insistence on the subjective concreteness of “absolute knowledge”—or what he calls here “the withdrawal of self-consciousness into its own pure inwardness”—had its origin at Frankfurt. We cannot tell how far this way of thinking was a “debt,” because it was Hegel himself who developed the detailed conception of Jesus as the Beautiful Soul; and it was probably Hegel who developed the theory of the “forms of Union.”³⁴ The “Hellenic Ideal” around which this general theory crystallized was originally Hölderlin’s; and even Hegel’s “Tübingen fragment” should (in my present view) be regarded as a testimony to Hölderlin’s influence.³⁵ But the influence operated upon an abiding interest and commitment of Hegel’s own. This can be demonstrated, for example, in the crucial instance of his concern with Sophoclean tragedy.³⁶

In any case, the debt to Hölderlin is implicitly acknowledged when Hegel’s reference to his mental breakdown places him firmly as the climactic *Gestalt* of the Beautiful Soul. Hegel’s repeated references to this *Gestalt* (the present allusion being the last) show how important it was in his own thinking.

Hegel’s debt to Schelling, on the other hand, although real and arguably enormous, was completely self-liquidating. He came into Schelling’s circle with the declared mission of providing the Identity Philosophy with its own “logic.”³⁷ This put him into a *critical* relation to the intellectual intuition of “A = A” from the first, and made him ever more conscious of his debt to Kant and Fichte. In the end, Fichte’s “Ich = Ich” triumphs, and absorbs “A = A” completely. Schelling’s speculative insight has all flowed over into the discursive unfolding of the *Phenomenology* itself. The “aether” of *Erinnerung*, on the other hand, is Hölderlin’s “Father Aether” which is never “liquidated.”

When Hegel returns to argue briefly in the Preface (par. 14) that “Science, at its first beginning” should not be subjected to a criticism that attacks its “essence,” he does mean, I think, to acknowledge that Schelling made a vital contribution. The rest of his discussion there only amplifies the dismissive line of argument sketched in paragraph 803; but we can recognize the triad Spinoza – Fichte – Schelling clearly in paragraph 17. Since at that point, the philosopher in whom “thinking unites the being of Substance with itself and grasps immediacy, or intuition as thinking” is unmistakably Schelling, we must conclude that Schelling (rather than

Spinoza) is the *Gestalt* of the “bare sinking of self-consciousness in Substance and the non-being of its distinction.” Thus we can fairly say that the last pair of *Gestalten* to be reconciled in the *Phenomenology* are Hölderlin and Schelling.

Actual spirit is neither the subjective retreat of *Hyperion*, nor the immediate submergence of the self in the *Sache selbst* achieved by Schelling’s “intellectual intuition.” Rather it is the cyclic *movement* from the one to the other and back again, which is portrayed in the history of the Manifest Religion, and conceptualized (*begriffen*) in the *Phenomenology*. First the Ethical Substance must be “betrayed” (par. 703), and the absolute subjectivity of Reason must slowly and painfully emerge in the Empire and the Church; this is the “self-distinguishing of the subject from its substance.” Then it must make its own circle to full self-consciousness in Rationalism, the Enlightenment, and Rational Moralism; *this* is the proper “coming to be of the pure Ego.” The completion of this circle enables us to comprehend the earlier “self-emptying” of Substance in the religious tradition; and so finally the self-conscious Beautiful Soul can return to a philosophically comprehensive unity with the *real* community of Reason.

This is Hegel’s achievement on the basis of the “instinctive” speculation of Kant, the “formal idealism” of Fichte, and the intuitive theories of Hölderlin and Schelling. The *Phenomenology* demonstrates how “the Concept” (i.e. the substantial movement of the *Weltgeist* in Western culture, which is evident to philosophical observers like ourselves as a gradual self-transformation of the communal beliefs and convictions about God, man and our human duty and destiny) is the moving force—the “necessity”—in the whole process. The self-conscious *personality* emerges as the *Dasein* of the Self in the Empire, and has “Substance” (i.e. God) as its “essence” in the Church.

To say that what is moving is “the Concept” is to say that nothing but the movement of human social Reason, with all of its material needs and its ideal aspirations, is involved. It is these needs and aspirations that human social Reason “portrays” for itself under such forms as the Unchangeable, the Will of God, Destiny, the Way of the World, the law of Duty, and finally as the all-creative Logos incarnate in “every man that cometh into the World.” When this last *Vorstellung* is properly comprehended Reason is fully “self-conscious,” and the *Phenomenology* can be written. The self-conscious ego must not cling to its subjective identity with the Logos in its inwardness, in preference to its real identity with the world of actual Spirit, and the recollection of its history as absolute Spirit. Rather it must go outwards and downwards, to recognize itself in its actual and spiritual world. There are no grounds for any fear of being “sullied” by this movement. For whatever is alien or *evil* in it, is transfigured into the “knowledge of good and evil” by the motion itself. The “force” (*Kraft*) of the Spirit is properly evident in its maintenance of self-identity throughout the motion. Everything is to be known as *ours*; and how it is known is for us to choose.

Thus, to take the most awesome year of the post-Hegelian era, no philosophical comprehension can affect the twin horrors of Auschwitz and Nagasaki,³⁸ which were *manifest* in 1945. But we must comprehend them in every way we can, as

things that man has done. We must use *concretely* the same Reason that planned and perpetrated them in its “enlightened” condition of abstract self-alienation. To cast them into the Abyss of some incomprehensible transcendent “Being,” or to regard technological Reason as a kind of superhuman devil, and claim that “only a God can save us,” is to make *all* aspects of human experience equal in their futility. It makes everything “the same.” But the vital nerve of Hegel’s dissent from the Identity Philosophy is the insistence that the “knowledge of good and evil,” through which Spirit is eventually “reconciled” with evil, begins with the clear recognition that good and evil are *not* “the same.”

The “absolute knowledge” that “returns into itself” is *not* the same as “forgiveness.” It must comprehend everything, but it does not have to “forgive” everything over again. There is room in it (just as there was in the religion of Jesus) for “the sin against the Spirit.” But it is for us to define that, and to comprehend it theoretically; and we *know* that it cannot be abolished, except in the self-abolition of the human community. If we must stand in awe of the destructive potential revealed by the horrors of 1945 as an alien power, then it is best to regard that power as a kind of “Fate,” and not as any “judgment of God.” For there is nothing so rational as “justice” in it; and “the Concept” in its aspect of “absolute negativity” or “wrath” does not require us to dignify what happened in that way. Death remains nothing but the natural fate of life, whether it be the death of one on Golgotha, or the death of all in Armageddon. It is only “recollection” that can make death significant.

(d) *The Circle of Experience*

- 18./805. The motion of the *Gestalten* stops here; the self-concept is achieved. The content is just the self-alienation of the self for its expression; its rational evolution is its necessity. The content is essentially relational, it moves of itself toward supersession; both necessity and free being are equally the self, and in this subjective “form” the “content” is the self-concept. Spirit unfolds in its own aether as *Science*; but the moments of its development in Logic are determinate concepts, not embodied shapes. There is no dialectic of experience and its truth-concept, but an identity of self and essence as a self-developing concept; the definition itself generates the dialectical movement. But a *Gestalt* of consciousness corresponds to every abstract moment of science; spiritual being is neither richer nor poorer. Cognition of the *Gestalten* is the real side of Science, in which the concept sunders its own moments.

The reconciliation of the Identity Philosophy with its history is the completion of the *Phenomenology of Spirit*. Spirit is now fully manifest to itself as the concrete principle of “self-knowledge.” Any rational person who wants to know herself adequately (in the philosophical sense in which Apollo commanded humanity generally to “Know Thyself”) must strive to know the world that has made her what she is, and in which she is to become whatever she has it in her to become at her best.

There are, of course, other forms of “self-knowledge.” One for whom it is problematic “what to become” (and for whom the options offered by “the world” are less problematic) may very reasonably devote herself to “self-observation” of the

rationally-empirical kind; and the repertory of means for such observation (in psychology and the other "social sciences") is now by no means as limited, or as useless, as the introspective observation of a "bag of faculties" to which Hegel gives such short shrift. But the self-knowledge that is true self-enjoyment is the "absolute knowing" in which Hegel's "science of experience" culminates.

What interests Hegel about it, however, is not its use as an organon for the relating of the "being-for-self" of the thinker to the "being-in-itself" of the spiritual world, but its propaedeutic character as the portal of properly scientific or systematic philosophy. Hegel was himself "condemned to be a philosopher." For him it was the exposition of "the Concept in its objectivity" that was the appointed task.

The first form of this objectivity is the "being-in-itself" of the Concept as "pure thought." This is the element of Hegelian "logic." The pure thinking through which we now have "absolute knowledge" of the self that "recollects" the complex history in which it both "made itself" and "was made," is the "pure element" in which the Concept "is there" as pure Concept. The "pure movement" of its self-utterance and self-recovery is just what Hegel expounds once more as a conceptual movement for itself alone, i.e. as the *method* of "pure thinking," in the *Logic*.

The "Science of experience" establishes the beginning of "pure thinking" *absolutely*. The "absoluteness" is the self-standing wholeness of a completed circle. We comprehend at the end the identity of experienced time as simple transience with time as eternal preservation in "recollection." This identity is the unity which distinguishes and unites all rational selves. The return to it at the end of the *Logic* establishes it again in the purely logical sense—which is the discursive or mediated form of conceptual necessity that replaces the mathematically intuitive character of logical "necessity" in Descartes, Spinoza and Leibniz.³⁹ But the discursive process of the *Logic* itself can only be "absolute" in a relative sense. *Dasein*, even the *Dasein* of the Concept, is not "eternal" in the Platonic sense; for that would take us back to the old intuitive sense of eternity which has been sublated. The Hegelian logic itself is an organon of historical knowledge.⁴⁰

That Hegel's logic, in its discursive aspect, is flexible and elastic, is evident from his own fifteen year effort to produce the simplest, most economical and easy to follow version that could be devised for his *Encyclopedia*. The basic project is to provide a purely conceptual statement of just that identity of the thinking self with the world, which has been exhibited as the ultimate truth of *experience* in the *Phenomenology*.⁴¹ The students to whom this logic was taught—especially in its earliest form—did not know a great deal about their cultural world and its sciences.⁴² But they had to be given a conceptual schema that was adequate for the right organization and orientation of what they did know, or were supposed to know. They could not be taken through the self-education of the *Weltgeist*, because that presupposes a great deal of knowledge of the history of ancient and modern society, the history of Western religion, and the history of Western philosophy. So a very simplified substitute for the *Phenomenology* had to be provided to get them to the starting point; and their own Protestant religious education had to be heavily relied upon.⁴³

The crucial necessity was that the transition from the religious standpoint to the philosophical standpoint should be made. For this, what is essential is the understanding of what pure thinking is, the comprehension of what “absolute knowing” is, and the grasp of what logic *aims at* (viz. the comprehension of what “self-knowledge” is, and the orientation of the rational self in the world).

It may seem strange to speak of “what logic *aims at*.” But if we do not allow this question to be asked, we cannot comprehend how the Hegelian Left eventually came to give a wrong answer to it. They thought that having comprehended the world logically they could *use* the Logic to *change* it. In so doing they fell back into the dialectic of action and judgment; for while they were acting themselves, they used their supposed possession of Science as a foundation for the “judgment” that they passed upon the opposition which serious action inevitably brings to birth. In this sundering of the Concept, the Hegelian conception of Science as the *act* of comprehension, was shattered and lost completely. Subjective *insight* claimed to be “Science”; and all forms of substantial “faith” were condemned as “ideology.” This was the distinctively modern dichotomy that Hegelian logic, properly employed, is meant to preserve us from. So here again we *must* ask the question in order to *return* to “self-knowledge” with fuller self-consciousness.⁴⁴

“Logic” is the absolute freedom of self-consciousness. It is the pure “for-itself” of the absolute Substance set free; hence it is absolutely restless, it is negative and dialectical. When we are thinking “purely,” we are never satisfied; so Hegelian logic is like the Platonic dialectic in that it can never be “finished” in principle. But if we know where the circle begins and ends, it can be “complete.”

This paradox accounts for the fact that Hegel was always trying to do it again. He also tried to persuade his students not to do it independently. This reflects his uneasy consciousness that they did not yet really know what it was; the whole history of the “school” confirms that he was right about that.

In attempting to simplify logic, and to bind it up closely with “Real Philosophy” in an encyclopedic handbook, Hegel was taking the best way towards the resolution of this problem. Only within the larger circle of the *Encyclopedia* can we appreciate what the circle of the “pure concepts” is, and what it articulates. Hegel already understood this when he was writing the *Phenomenology*; the “System of Science,” for which the Science of Experience was to be both the “introduction” (in the *open* aspect in which it leads us to the “element” of Logic), and the “first part” (in its comprehensively *closed* or circular aspect, as a complete “Science”), was to be completed in one more volume, which would contain the whole “system.”

If we ask why this plan was abandoned, and eight years were spent on the elaboration of a “Science of Logic” which itself occupied three volumes, we are, of course, entering the sphere of “speculation” in a bad sense. But if we compare the *Science of Logic* with what Hegel was at the same time trying to do for his secondary schoolboys, and with the *Encyclopedia* which he began to produce and revise for University students, as soon as his “Subjective Logic” was in the press, two hypotheses suggest themselves. First, the attempt to simplify “the system” for schoolboys taught Hegel the risks of abstraction, and the dangers of authoritarian

dogmatism; and secondly the writing of the *Phenomenology* taught him that these risks and dangers could be obviated only by an immersion in the *Sache selbst* of philosophy which was as total as his immersion in the history of western ideology and religion in the *Phenomenology*.

The whole history of *philosophy*—the senators in “the slow moving procession of spirits” of paragraph 808—had to be comprehended in the circle of the angelic pure concepts, just as literature, religion, and sub-speculative thought were already comprehended in the ordinary human *Gestalten* of the procession itself. The *Science of Logic* is the educative discipline that Hegel put himself through, in order to be a pedagogue without degenerating into a pedant; and that is why (like the *Phenomenology*) it will always continue to interest serious students of philosophy more than the *Encyclopedia*. But the *Encyclopedia* remained Hegel’s goal throughout. This was the distillation of philosophy for the educated community generally (those who were not themselves “condemned” to be professional philosophers).

The *Science of Logic* is logic as the “self-enjoyment of the Concept.” It is for those who cherish the Platonic-Aristotelian ideal of pure contemplation—“being like the Gods, or as much like them as we can be.” The *Encyclopedia* shows us “logic *for* use, and logic *in* use”; it should preserve us from any “neo-Platonic fantasy” that we can really walk with the Gods in a “heaven beyond the heavens.”

I cannot *do* Hegelian logic very well; but I think I have understood what it is, and why it is vitally necessary. It is that understanding (the comprehension of “Science” even if only as a regulative ideal) that I should like to convey. For I am convinced that any view, no matter how “Hegelian” its inspiration may be—for instance, Croce’s “Philosophy of Spirit”⁴⁵ or Gadamer’s hermeneutics—, which takes Hegel’s “logical science” to be a dispensable illusion, is badly mistaken. It has no answer to the active missionary forms either of self-styled “science” or of “faith,” which will take us to Armageddon in their zeal; and no means of humanely comprehending the empirical sciences that will make Armageddon feasible for the rival zealots.

The motion of the concepts in the *Logic* belongs not to “experience” but to the “pure thinking” in which they are comprehended, and to the concepts themselves. We cannot look either to subjective experience, or to the substantial movement of the community to confirm it, since it is supposed to illuminate them. Hence Hegel can only offer a “dialectical” argument of the Aristotelian type in defence of beginning the *Science of Logic* with “Being.” But *he* knows that the reason for beginning with “Being” (interpreted in the way that he interprets it) is, on the one hand, the “absolute knowing” that makes him able to do logic in the first place—because it tells him what “logic” is—and on the other hand, the “absolute knowledge” at which he will arrive—which tells him that the “beginning” is not really “intellectually intuitive” in the way that it appears to be.

Hegel continued to speak of “intellectual intuition”; and hence, implicitly, to claim a “Platonic” status for the argument at the beginning. This was natural in the thought-context in which he lived and taught (as evidenced by the shortened historical approach to *Logic* in the *Encyclopedia*). But to me—with Hegel dead, and

his work before us in its objective spiritual shape—it seems more appropriate to view the beginning from the end. Nothing more than subjective preference and personal *Bildung* is involved in the decision. I would not try to argue with someone who insisted on the “intellectually intuitive” character of the beginning, for I have no idea what one could say (except that not everyone seems to have this “intuition,” and that it is only the eventual circularity that establishes the scientific objectivity of the argument as a whole).⁴⁶

We must turn now to the most difficult problem in paragraph 805 (and one of the most interesting assertions in chapter VIII). We read here that “to every abstract moment of Science there corresponds a shape of the appearing Spirit generally.” The “correspondence” is between the moments of Logic—since they are “abstract”—and the moments of “experience”—which are *concrete*, but for the most part “finite.” If we study Hegel’s theory of how the Infinite Spirit is in time we can see why he felt certain about the “necessary correspondence.” Only the absolute Spirit of Religion is properly “in time” (par. 679); and every shape of Religion is a determinate “shape of Consciousness.” So, at the level of the “biography of God” the sequence of “phenomenological categories” becomes strictly historical; and if every category is a “Shape of God” then surely it must be a necessary “categorical moment” in Logic also.

But already the complex relation between “Religion” and the finite stages of consciousness has taught us not to expect that the necessary “correspondence” between “categorical Shapes” and “categorical moments” implies a sequential *parallel*. According to Hegel’s theory of the *Dasein* of the Concept, the history of Religion must follow the logic of the *Phenomenology*; but we need not suppose that “pure Logic” follows quite the same historical course. It follows from what Hegel says here that every category in the Logic will appear in a complete phenomenological history of Religion. But chapter VIII itself shows us that Hegel was conscious that the history of “Philosophy” involves an *interaction* of finite and infinite moments. So it is quite possible that the view expressed in paragraph 85 of the *Encyclopedia* (1827 and 1831) is already operative in Hegel’s mind: the logical categories

may be looked upon as definitions of the Absolute, as the *metaphysical definitions of God*; more precisely, however, it is always just the first simple determination of a sphere that can be so regarded and again the third, the one which is the return from difference to simple self-relation. For to define God metaphysically means to express his nature in *thoughts* as such; but the Logic embraces all thoughts while they are still in the form of thoughts. The *second* determinations, on the other hand, which constitute a sphere in its *difference*, are the definition of the *finite*.

Of course, we cannot say for certain that this was so. There are many reasons why Hegel may have decided not to refer to this “correspondence” in the *Science of Logic* (1812) even though he still took the same view of its systematic relation to the *Phenomenology* that he held in 1807.⁴⁷

Hegel also says at this point that “Spirit in its *Dasein*” is neither richer nor poorer than “Science.” That the “science of experience” must in some sense embrace the whole range of “the System” seems obvious and necessary. Everything that belongs to experience is knowable in Science, and nothing is knowable at all that is not in “experience” (par. 802). But the way that everything enters into “experience,” organized as a science of historical evolution, is different from the way that it enters into the “Science of reality” as fully evolved. We have only to start looking for the philosophy of Nature in the *Phenomenology*, and compare what we find with what is in the System, to see this. The principal importance of the necessary identity between “experience” and “Science” lies in the implication that *nothing* we experience can *transcend* our logical grasp. That is my warrant for interpreting the name “God,” and the transition to the Infinite or Absolute Spirit, in the way that I have done. The “Beyond” must always be treated as *imaginary*, because (as far as our actual experience is concerned) it occurs only in the imagination, and its content is an imaginative projection of what we experience “Here.”

In spite of all that I have said, I agree that—since the *Phenomenology* of the Absolute is historical—Hegel *may* have believed in a “parallel” between *Phenomenology* and logic in 1806. It seems quite possible that he undertook the project of a “science of experience” in order to decide empirically (if possible) what pure Concepts must be systematically “deduced” in his categorical logic. Possibly he hoped that he would be able to use “history” as a control on the arbitrary freedom of reflective common sense. But I have no serious expectation that any generally persuasive logical sequence of “pure concepts” can be identified in the *Phenomenology*.⁴⁸

- 19./806. Science itself contains the necessity for the emptying out of the self-concept into the otherness of objective consciousness. For in grasping its concept self-knowing spirit differentiates itself as sense-certainty. This is its freedom.

After his brief characterization of the forward motion from the *Phenomenology* to the *Logic*, Hegel turns his attention finally to the closure of the Science of Experience upon itself. The Real Philosophy of Nature and Spirit has its experiential point of origin here. At the end of paragraph 805 Hegel spoke of the *Gestalten* of consciousness as the “side of reality” generally; and in this period he regularly expounded “Real Philosophy” as a whole. In phenomenological terms, the transition from Logic to Nature is not distinct from the emergence of finite Spirit. Nature is the Concept “in its otherness.” That means that Nature “is there” *for another*. The other for whom it is, is, of course, the thinking Concept itself; in its relation to Nature, the Concept falls from “pure thinking” to consciousness as the sense-awareness of an object other than itself. The phenomenological process of “consciousness” is therefore the *relation* between Nature and Spirit. Hegel says that in the phenomenological progression “the concept, which is posited in its *simple* mediation as *thinking*, strikes apart the moments of this mediation, and presents itself in accordance with the inner antithesis [between them].” In other words, “Spirit” (as absolute) is logically first, and Spirit as finite is experientially

first.⁴⁹ The “phenomenology of Spirit”—the motion from finite to infinite Spirit through the “Shapes of consciousness”—is the process of experience through which Logic, the science of what is “eternally necessary,” and Real Philosophy, the science of what is empirical and historical, become independent and distinct. This independence can only be established when the motion of experience is completed in time, so that the whole circle of Spirit is there for knowledge. The knowledge of it is the comprehension of how Necessity (both logical and physical) is comprehended within Freedom—or of how logical Eternity is comprehended within temporal experience.

The “sense-certainty” of consciousness in its immediacy is identical with the primitive antithetical relation of Nature and Spirit in their immediacy. But even here we encounter an interesting inversion. Nature as it exists for the immediately practical consciousness of the finite spirit is, first of all, spatial; but consciousness, as it exists for itself (as the theoretical quest for the self-consciousness of absolute knowledge) is first of all *temporal*. So the *Phenomenology* begins with *time*, and the Philosophy of Nature with *space*.⁵⁰

The fact that in paragraphs 805–808 Hegel is discussing the relation between the “Science of experience” and the “System” is obvious, and it has been universally recognized. But we need to remember that he is completing the Science of Experience, and *not* giving a bird’s eye view of the System. All that he wants to show is that the science of the *Gestalten* is neither “richer” nor poorer than the “System.” The Logic for the System of 1806 we have lost; but the Real Philosophy we still have. So we should not be misled into making superfluous “hypotheses” about it.

Hegel treats the transition from “logic” to “consciousness” in its *phenomenological* perspective. He is not looking ahead to the exposition of the System, but only showing how the *Phenomenology* is related to the starting points of the different sciences in the system. In paragraph 806 he makes the transition only from Absolute Consciousness back to sense-consciousness as the starting point of the *Phenomenology* itself. That is to say, he makes the circle of Consciousness back to the beginning of its “Science.” But the connected “primacy” (empirical and logical) of the beginning and the end of the Science of Experience explains the otherwise mysterious transition from Logic to Nature in the “System.” If we begin from the first sentence of paragraph 802 as an axiom (or a descriptive stipulation about the task of philosophy) everything becomes plain.⁵¹

- 20./807. But this emptying out into sense-certainty is not perfect. Because of the connection with self-certainty, the object is not free. Knowing knows not only itself here, but its limit; hence it knows how to sacrifice itself. This sacrifice is the alienation in which Spirit intuits its coming to be spirit. It becomes Nature with space as its being, and time as its externalized self. As alienated Spirit, *Nature* is just its eternal uttering, and the movement that sets up the subject.

Much of what I have just said about paragraphs 805–808, is validated not in paragraph 806, but only here in paragraph 807. Only now does Hegel speak of the

absolute alienation of the Spirit as nature proper; and he looks at it under the aspect in which it is relevant to the *Phenomenology*. In the movement from “pure thinking” back to “consciousness,” complete alienation, complete “emptying out” [*Entäusserung*] into “otherness” is avoided. There is a circle precisely because consciousness is a mode of knowledge. It is implicitly self-consciousness. Thus the science of consciousness must traverse the field of *nature* in its connection with the self; but when we reach the evolution of religious consciousness we realize that the independent objectivity of nature, recognized in simple consciousness, and conceptualized as the “Infinite” of Understanding, is necessary for the self-constitution of rational self-consciousness.

At this point, the rational self-consciousness can comprehend, at last, the “sacrifice of itself” that it made in order to be born as Reason. As Unhappy Consciousness, it had to make an apparently quite irrational leap of faith in order to be “saved”; in the Manifest Religion it comprehends this leap as the reconciliation of God with Nature; and in comprehending the identity of God’s act with its own, it comprehends that neither of them was gratuitous. In their unity they are one and the same *free* but logical act. They are not two contingent acts at all, but the positing of an “otherness” which is logically necessary if there is to be contingency (and hence a free return of selfhood to free self-consciousness) at all. Nature, as the sphere of *reality*, is the element in which the free self-positing of the Spirit can take place. It is “necessary” as the stage for the free creation of the Spirit, out of the nothingness to which it reduces Nature, by turning against it.

The whole religious story of a contingent sequence of partly mythical and partly historical events is the “spiritual substance” that has to be recollected in the *Phenomenology*. Thus the *Phenomenology* presupposes Nature; and by implication a Science of Nature, as the simple objectivity of the Concept, must be possible. But Hegel is not here concerned with that science; and he is not directly saying anything about it. What matters is that without Nature, there cannot be “experience”; and hence there cannot be the Science of Experience.

There is thus a “circle” between the Science of Experience and the *logical positing* of Nature. Hegel’s remark that “To know its own limit means to know how to sacrifice itself” is more intelligible to me in its phenomenological context, than in the context of Logic. The strange sentence at the end of the Logic about “the Idea *resolving* to let itself go,” should be interpreted in terms of the “leap of faith” and the “comprehension” of Religion. But I am thankful to be able to set aside the task of interpreting that sentence here.

- 21./808. *History*, as the other side of its coming to be, is the knowingly self-mediating becoming. But this emptying out of Spirit in time is also the alienation of alienation. The developing motion is a slow-moving gallery of pictures each endowed with all the riches of spirit. Comprehension takes the past up into the self, as a memory to be drawn forth out of its own night. It is drawn forth as a new *Gestalt*, born from Science [cf. pars. 11–12]. This new *Gestalt* has to mature slowly, with its origins all lost in the night of memory. But the record of achievement is all there, and hence the new development starts from a higher level. Thus, for Science, world history is a *realm of spirits*

forming a procession, and now the procession has come full circle. The “time of the Concept” has arrived, because the whole circle has been raised out of the depths. This recollecting is both the path to, and the content of Absolute Knowing. As a riot of free expression the procession is History; as a comprehended pattern they are the phenomenology of absolute knowing. As both together (History comprehended) they form the innering and the “skull-place” of Absolute Spirit, the point from which the true infinity of human life foams forth.

We should have noted in paragraph 807 that the Concept of Nature is self-inverting. Nature, in its independent objectivity, is the “true Infinite” of Understanding, the “logically living” process that sustains all mortal life (including the human Understanding) within itself. It is under this aspect that Nature can be called the “living immediate coming to be” of the Spirit. The “coming to be” of Spirit from Nature has two aspects; there is the biological organism called *homo sapiens* (which nature contributes); and there is the cultural *Bildung*, through which *homo sapiens* becomes actually sapient.

This cultural *Bildung* is the “self-creation” of Spirit proper. In its most fundamental (substantial) aspect it reaches out and transforms the physical environment, both organic and inorganic, so that “absolute knowing” is led to the recognition that the “true Infinite” of Nature as a whole is its own real substance. But as the “knowingly self-mediating” aspect of the coming to be of Absolute Spirit, this “self-creation” is the formation of our communal self-consciousness in history. Until it comes to complete self-consciousness the history of this communal self is the “biography of God”; its completion ends that “biography” properly with “death.”

When Hegel first speaks of the history of the Spirit as “a slow movement of spirits following one another in procession” he has to be referring directly to the community-spirits, i.e., to the shapes of “God.” This appears to be confirmed when he says a bit further on that “the kingdom of spirits . . . makes up a procession in which each one discharged the other one [preceding it], and each took over the kingdom of the world from its predecessor.” But the two processions are not quite the same because the first is the naïve procession of history as *res gestae*; and the second is that procession as recollected in the Science of Experience—the absolute *historia rerum gestarum*. The *Phenomenology* comes between them, and makes the transition from Religion to Philosophy.

The reborn Spirit is one that “begins its culture again from the beginning, seeming to go forth only from itself, but at the same time it is on a higher level that it begins.” This resurrection is a procession of human spirits (communities of *individuals*), ending with the marching company of the philosophers regarded as the conceptual *kings* of their community, because (in spite of what the community of the orthodox faithful, or the philosophers themselves as theologians may think) they are the true spiritual architects of the “self-consciousness” of their communities. Already, at a crucial turning point in the naïvely historical process of religious consciousness, the human artists knowingly “invented” the Gods; and the naïve historical procession reached its climax in a human self-consciousness that was clearly aware of its identity with God.

Philosophy proper moves on the higher plane constituted by that “self-certainty.” This transition from Religion to philosophy was the necessary goal of the naïve procession itself. For the “fulfilling” [*Vollendung*] of that “gallery of pictures” (the Gods, but not the spirits of scientific recollection, are *Bilder*) “consists in this, for the Spirit to *know* completely that which *it is*, its substance.” And hence “this knowledge is its *going into itself*, in which it abandons its way of being [*Dasein*] and gives its shape over to recollective inwardizing [*Erinnerung*].”⁵² The historical movement of religious consciousness is unconscious (“sunk in the night of Spirit’s self-consciousness”). But for our scientific recollection it is all there as “experience”; and so we have been able to bring it out into the daylight of reflective self-consciousness. The whole substance has been preserved in a higher form (i.e., as the Spirit, the Substance which is equally Subject) by the “*Er-Innerung*” of experience.⁵³

It is not we alone (the philosophical historians) who “inwardize” the cultural procession. History, as the establishment of a communal tradition, a universally shared body of memory, already does a great part of the work. But we raise it into reflective (and finally self-conceptual) consciousness; and we do this by organizing it logically so that its shape and significance can be seen. And now as we look back at the “inwardizing” of Reason, the communal Logos, and comprehend what *we* have done as its transformation from the “Son” into the “Spirit,” the whole character of *our* achievement changes. As our Science becomes complete, and the transition from religious consciousness to philosophy is made self-conscious, its real significance is comprehended properly for the first time. The Science of Experience itself is now established as a truly philosophical achievement.⁵⁴

The meaning of this achievement is twofold. First, the character and status of speculative philosophy itself is transformed. “Philosophy,” the desire for wisdom, becomes “Science,” the possession of knowledge. As the love of wisdom, philosophy had to exist under the aegis of the substantial tradition of its culture. Since the communal self-consciousness, in which that tradition was thoughtfully possessed, is precisely what the community represents to itself as its “God,” the earlier situation was that philosophy existed all through the long slow movement of the “gallery of pictures” as a mediating *minister* of the *substantial* religious consciousness. Philosophy was necessarily “speculative theology,” the theoretical consciousness of the “true Infinite” as the Absolute Self in its transcendent “otherness.” Spinoza and Leibniz (between them) “invented” the God of the rational community, as a *frozen* Concept of the Understanding.

As the moment of its own fulfilment as “Science” came nigh, this “theological” consciousness was alienated from itself, and entered into its *Gegensatz*. In place of speculative theology, the *critical* “philosophy of experience” was born, which recognized Substance as a *not-self*, the Unknowable, and itself as “Reason,” the truly universal subjectivity. That was when the *reflective* recollection of what the communal substance was, became possible. The love of *God’s* wisdom could now, at last, become the self-possession of the human community’s “Science.”

The fulfilment of this transformation is the “Science of Spirit” in the “Encyclopedia of Philosophical Sciences.”⁵⁵ As long as “the Spirit” was religiously con-

ceived as a transcendent “force,” no Science of Spirit was possible. But the *absolute* consciousness that we have reached shows us that the “objectivity” of the Spirit is just the real objectivity of our social institutions, and the ideal objectivity of our cultural tradition. The logical structure of this can now be expounded quite systematically and comprehensively. Rational *self*-consciousness of this scientific kind (not a mystical union of some kind with the Absolute Other) can be exhibited demonstratively—or “necessarily”—as the goal of our existence as *homo sapiens*.⁵⁶

The climax of this Science of Spirit will be the systematic portrayal of the religious “gallery of pictures” which have already come before us in their “slow procession” in chapter VII; and chapter VIII of the *Phenomenology* will be replaced by the “recollecting” procession of the philosophers who are only described in the distance here. We have already seen that the phenomenology of the Manifest Religion provides the proper context for the comprehension of the seemingly *gratuitous* “resolution” of the logical Idea to “let itself go” as Nature. Now we can see also that the climactic appearing of Absolute Knowing in the *Phenomenology* is the closure of the Science of Spirit into the great circle of the Encyclopedia. The last of the professors in the philosophical procession is Hegel, as the inventor of speculative logic, and the first explorer of “absolute knowing” in its “aether” (the *spiritual* “element”).

So much for the transformation of “philosophy” generally into “Science.” Now let us consider the second aspect of the achievement of the Science of Experience, its *internal* significance. The goal of philosophy is “the revelation of the Deep, and this is the *absolute Concept*.” The darkness of the deep is to be turned into a visible extended surface. When this is achieved scientifically the surface illuminated will be a conceptual *sphere*, the conceptually organized and comprehended “extension” of Real Philosophy. But the path to it is the human quest for knowledge, as a voyage of discovery in which we recognize first our own “accidental” character as mortals, and our dependence on the social substance for our rationality; then our own creative role as rational “makers” of the substance; and finally our spiritual relation to, and absolute significance in, the divine (or *absolute*) substance. We are the “subjectivity” of that substance.

Absolute Knowing, which is only the element, the “aether” of properly conceptual science, is *discovered* by the *Phenomenology*. What does it do to our journey when, like Dante in the Sphere of the Fixed Stars, we look back upon our journey from the height that we have reached? What happens when our long pilgrimage through the *history* of our community is united with, and comprehended in, the Absolute Knowing that is its “result”?

Hegel responds with the *Vorstellung* that forms the central paradox of the Christian “revelation.” But he transforms it. What happens is at once *death* and *resurrection*. We arrive at Calvary, the place of Crucifixion, because *all* of the *Gestalten* must now perish in order that conceptual science may come to be. This much is fairly easy to comprehend. It has not generally been appreciated that “Jesus” is the tragic image of the birth of “Absolute Philosophy”; but we have commented on the transition from the *Gestalten* to the pure Concept(s) of Logic already.

It is the Resurrection image that is radically transformed. For this is not a resurrection of Christ, the Divine Logos who must ascend to Heaven in order to come down again in his true universal shape as Spirit. This is not God manifesting Himself to us, by coming down in order to return to Himself and then come down again. This is the display of the finite individual spirit to God (the Absolute Spirit, i.e. the Body of Christ or the Universal Community). All of the shaped Spirits who have been crucified for the birth of the pure Concept, and who have sacrificed themselves for the birth of Science, are now *finally* resurrected as the *ultimately real substance*, the “In-itself” which the absolute “For-itself” of Science is *for*.

The Science of Experience is the “chalice” from which this resurrection, not of Spirit but of *spirits*, “foams forth.” The resurrection of the finite spirits is the *final* goal, meaning, and “result” of the Science, because the “foaming” here produces the very same procession of Spirits with which the “Science of Spirit” concludes and returns into Logic. But in the perspective of the “chalice of experience” we can comprehend that it is not just a procession of those privileged (or “condemned”) spirits called the “philosophers.” Jesus, the man who died for reconciliation, leads forth out of the “deep” of self-consciousness a procession that embraces consciousness in *every* form. The resurrection of Christ is in us, the philosophical observers who have become “science,” the divine or absolute knowing for whom the procession “foams forth”; but this resurrection of the dead is the recovery of every aspect of experience in its conceptually necessary aspect. It *has* to be that in order for the “science of knowing as it appears” to comprehend the whole of Real Philosophy in its own way—not just the beginning and the climax of it.

Commentators generally seem to take the reference to Calvary only in its mystical-religious sense. But they do not even offer an explanation of why the mystical reference to the “death of God” on Calvary is appropriate here. The *Phenomenology* mediates the transition between the two *processions*—the procession of divine *pictures*, and the procession of human *thinkers*. Thus it is the conceptual exposition of the one transitional figure who is both a divine picture, and a human thinker. It is the *philosophy* of the “life of Jesus,” including his death and Resurrection. It liquidates the Ascension and Descent of the Spirit completely, by interpreting them as the resurrection of Christ in us. But when that liquidation is complete, so that the God-picture is no longer logically necessary—then the figure of Jesus, the first Beautiful Soul to achieve full “reconciliation” with the world, is logically the first *human* spirit to be resurrected into immortality *for* us, the first to “foam forth” from the chalice of experience comprehended.⁵⁷

The moment in which we look back over our journey, and bind it into the circle of a conceptual “science” by joining the end to the beginning, is the moment when “Now” comprehends “Eternity” concretely. Each of us is the subjective “difference” of the Self from the Substance (par. 804). We now have, and we know that we have, that “richest cognition” that sense-certainty claimed to *be*, but which it could not articulate at all.⁵⁸ Sense-Certainty is in actuality so *poor* that, although we can only effectively *forget* it by “going to the death,” it is the one level of experience at

which actual, living, self-assertive consciousness cannot obstinately *remain*. When the Sense-Certain Consciousness talks at all (beyond the level of Night and Day) it must speak the language of Perception. As soon as it *extends* itself into Cognition proper it must *point* to real “things,” objects of perception in space, saying “Here is a house” (or a “tree”); and for this pointing it must *use* “concepts.”

Yet now we know that the pretence of Sense-Certainty was not vain. It becomes finally the existential side of the “element” of our Science. Our recollective Now contains “riches” that the sensationalist philosophers did not dream of, and do not know how to handle. It is a “sense-certain” (as well as a “self-certain”) moment. So we can comprehend, for example, how an artist like Turner can show us God, by *fixing* a moment of sense-certainty in a *picture* (a storm almost as dark as Night, or a sunset). And because of what Turner can *show* us, we can divine what the inarticulate consciousness of Sense-Certainty *feels*; we can interpret what we ourselves have felt, at least vaguely, and sometimes powerfully and explicitly, at some moments of our sense-experience. Hence this consciousness too, whose grounding presence we must and do recognize in our concretely scientific comprehension of “eternity”—even though we must necessarily *not* be attending to it at the moment of our “recollection”—this sense-consciousness, too, has to be recognized as “the actuality, truth and certainty of Spirit’s throne.” We experienced it initially as the Calvary in which Spirit died and all truth was lost. But it too must come forth from the grave, for without it nothing else can, and even our purely conceptual absolute knowing cannot subsist without it. The Resurrection itself really began with Peter’s thought of that *face* looking at him, when he “went out and wept bitterly”—and he certainly knew he was weeping.

If the truth standard of Sense-Certainty is necessary to Absolute Knowing, then so are all the others; and when they are integrated into the context of absolute self-consciousness—as they must be when we read the book again *scientifically*, because Absolute Knowing is now with us self-consciously from the beginning (and not just as the “instinctive” rational knowledge of what neutral “observation” is)—then every form of non-philosophical consciousness is raised for us in its proper “shape” of eternal life.

Jesus, who was no *philosopher*, still less a “scientist,” is the proper presiding spirit for the *Phenomenology* because the Science of Experience is the “salvation into eternal life” of all the *non-philosophical* forms of experience and concepts of truth. Philosophy and philosophers make few appearances in it; and except in the Preface and this last chapter, those few appearances are almost totally negative. Philosophy appears only as what it is not. It is *not* the Understanding, even though the Understanding aspires to be “Science,” and does formulate the concept of the “True Infinite.” Stoicism and Scepticism are the abstract forms of Logic, and its *Gegensatz* the dialectic. Reason is “instinctively” speculative. Fichte is the “formal” idealist; and in the “Spiritual animal kingdom,” the speculative *Monadology* of Leibniz has been wrested out of its logical eternity into the empirical dialectic of time, with a violence whose legitimacy we can only accept if we grant that the evolution of *actual* Spirit is paramount over the self-conscious will of the thinker. In

“Law-Testing Reason” Kant comes before us as the “shape” of philosophy in its absolute defeat—the logical emptiness of Stoicism returned.

With the glancing reference to “the Cartesian metaphysics” (par. 578), genuine speculation makes a *positive* appearance as the standard against which its *Gegensatz* in enlightened empiricism is to be measured. But again it is the paramount might of *actual* Spirit which, in order to forward its own evolution, has taken Descartes’ “theological” insight and deformed it into these “unphilosophers”⁵⁹ who are its willing and necessary ministers.

Finally in the “Moral World-View” we are given a sight of speculative philosophy struggling to escape from its bondage as the “handmaid of theology” into self-conscious freedom. But it cannot win the battle, because of the *substantial* commitments of Faith that it still has; and the “rational faith” that it produces, is even more obviously “unphilosophical” than the Deism or the Humanism of the Enlightenment. It is the religious consciousness that wins all of the battles, and absorbs all the forms of consciousness, with which the *Phenomenology* is directly concerned. Thus the resurrection of the spirits from the chalice of experience is the resurrection (and eternal justification) of all the *non-philosophical* forms of consciousness universally.

And that, in the end, is why there are no personal names in the book—or as few as Hegel can manage with, and those few used always *emblematically*. The book is not about the eternal salvation of Parmenides, Anaxagoras, Sophocles, Plato, Aristotle, Origen, Dante, Bacon, Hobbes, Descartes, Spinoza, Leibniz, Locke, Newton, Reid, Diderot, D’Holbach, Robinet, Kant, Herder, Fichte, Jacobi and Schelling; it is about “Everyman.” And therefore it uses more freely the mythic figures of Everyman: the nameless Serf and his Lord; the nameless professors and their named “schools”; Oedipus, his sons and his daughters; the Roman Emperor, the Pope, and Luther (but none of them, not even Constantine, by name); Young Rameau, Faust and Gretchen; and the Beautiful Souls. Literary *Vorstellungen* serve best to represent actual Spirit, just as the Gods stand for the self-consciousness of their communities. This is because in the end it is every man and woman who steps forth from the chalice *here and now*, and not in that Heaven of the Christian promise of universal salvation into eternal union with the “Father” who loves us all to the point of absolute self-sacrifice.

Every one of us, philosopher or not, must *comprehend* our *lives* as best we may, including especially the education that has made us what we are, and able to do whatever we can do, with enjoyment. Many do not know that this is what happiness is (the “activity of soul in accordance with virtue”); many more have some inkling of it, but life offers them no reliable way to its steady achievement, no adequate means for the sort of self-realization that can be enjoyed. The comprehensive knowledge of what life-comprehension *is* will help both groups—and the philosophic science itself that is still to be constructed, *may* possibly help in the social reconstruction that the latter group need. Even after the fall of Napoleon, Hegel was as much concerned with that as a professor could be in a dark time; but his most important successors (who could not get, or could not keep, their professor-

ships) went to the opposite extreme and allowed the goal of social reconstruction to overturn comprehension into the alienated “unphilosophy” of the Enlightenment once more.

Hegel was concerned with Comprehension as the human goal of *self-realization*. That is what his Science was about. One does not have to have the Science in order to achieve self-realization;⁶⁰ the Science itself shows why that is the case. But the Science can, and it should, inform all of our educational institutions; and it can be used by those who have it, to mediate the conflicts of those who are “instinctively” happy (i.e. they have found rational self-realization in some non-philosophical form). It can do this, or at least attempt it with confident hope, because those who are “happy” in this sense must by definition have “the Absolute with them” as the spirit of charity and reconciliation. For those who are “unhappy” still, it can do little or nothing (except indirectly through its institutionalization). The Science itself shows why they must, in one way or another, come to the Calvary of *religion* first. We can only hope devoutly that the renewed battles between the alienated Enlightenment and the traditional “faiths” (together with the battles of the faiths themselves) will not bring us all to the last Calvary.⁶¹ And we must do our best (in spite of my logical pessimism about the reconciliation of the unhappy through “insight”) to “enlighten” both sides in the full speculative sense. For we *know* now that the only Providence watching over us is our own.⁶²

Notes

1. There is a French translation of this chapter, with sentence by sentence commentary by B. Rousset (1977). But it is not very helpful.

One can say with M. Theunissen (1970, 223–224): “The knowing of God becomes a knowing of oneself *in* God as the one who supports and comprehends man. To the extent that this knowing of oneself *in* God, concludes the religious movement, man certainly transcends his abstract separateness, but never his separateness from God.” But this surviving “separateness” is a conscious distinction from the universal human Spirit (as we meet it, for example, in Croce and Gentile); and there is no need to speak of it as “*the one who . . .*” That “one” is equally well comprehended as “the We.” For a rather more “religious” view of this transition than mine see M. De Nys (1987) and L. Dupré (1987).

2. J. C. Flay (1984, 236) says that “the function of religion . . . is to make itself disappear” in its philosophical sublation. That may be what it does for him (and sometimes for me, and probably for Hegel too). But “disappear” is quite the wrong word for what logically *has* to happen (in society). I have tried to show that the “absolute religion” is recuperatively reconciliatory (or *at least* ecumenically charitable). Someone who is religiously *committed* can go on from this conceptual transformation of her “faith,” to do pure philosophy without experiencing any disappearance. It is arguable, indeed, that even for someone as uncommitted as myself (a typically “inauthentic” professor enjoying the Jamesian “moral holiday”) whatever religious “recollections” are still present, are *enriched*. M. Westphal’s use of the Marxist “withering away” metaphor (1978, 212) is a logical error, even if it is empirically accurate with respect to the “absolute culture” of our own society. Q. Lauer (1976, 255–256) is right; but R. Kroner (1961, II, 415), with whom the “faith-oriented” Lauer would no doubt agree, is not. Any honest philosophical observer must agree with Kierkegaard: philosophical self-

consciousness has no necessary connection with authenticity of “existence.” But someone like myself, who is more in tune with the moral “authenticity” of James, may be inclined to the view that S. Kierkegaard himself illustrates that! (Westphal, Lauer and Kroner are sufficiently cited in Flay [1984, 395–396, n. 17].)

W. Jaeschke (1992, 1) says that Hegel’s philosophy moves from the “death of God” to the “end of Religion.” On my view there will be many Hegelian philosophers for whom “Religion has ended.” But the problem of mediating the cultural conflicts of human religious traditions will continue to be the focal problem even of these “absolute humanists”; and in performing that task, they ought to recognize that Religion has *not* ended (just as Philosophy has not).

3. Thus Plato’s *Republic* is not “science,” because it has never been realized. The “absolute knowledge” of our religious tradition can be recognized in it, a fact which is hardly surprising, since Plato has had an enormous influence on that tradition. But logically speaking, Plato’s *Republic* only differs from those Gnostic myths about the identity of God and Man which failed to become “the belief of the world,” in virtue of the “self-conscious” conceptual form that his thought gave it. The Gnostic myths are *Vorstellungen*; Plato’s *Republic* is the “science” of *his own* “self-consciousness” and that of a few “followers.” Plato was less of a “dreamer” than the later Gnostics, because he still had a real “substance” to think about. But the Peloponnesian War had already shown that the model of the *polis*, which he accepted as his substantial base, was not in fact absolutely “substantial.” In fact, it had to perish, before the truly universal “Substance” could become visible.

4. J. C. Flay (1984, 238–239) says that the transition from Religion to Philosophy is not an *Aufheben* but a *Hinausgehen*. I am not sure what the distinction means, but I suspect that it only distinguishes between the *Aufhebung* of phenomenological experience, and that of pure thinking in Logic. In experience, the sublated content is still “there”; in Logic the content is itself *radically* transformed—we are not simply *seeing* the old *Sache* in a new way. The “absolute Religion” cannot be forgotten in the way in which Reason “forgets” the Unhappy Consciousness. The consciousness that advances to “absolute knowing” must have a *religious* content. But it may, for example, be the “humanism” of someone like Bloch, for whom the “otherness” of physical nature remains “absolute.”

S. Houlgate (1993) has given the right interpretation of this transition. The reader should study first his earlier article (1991) and the critique of J. C. Flay (1993). I agree with Houlgate throughout.

5. According to F. Wagner (1971, 180ff.) the sublation of Religion in this transition is only abstract. I agree that the dialectic of what is past and what is future is not positively sublated (1971, 195). But I cannot see that Hegel achieves a more adequate transition in the later system (as Wagner believes). (For a good study of the transition from religion to philosophy through the *history* of religion in Hegel, see T.F. Geraets [1989]; Geraets [1986] provides a good survey of Hegel’s *later* philosophy of religion. It coheres well with my account of chapter VII of the *Phenomenology*.)

6. Kant, *Critique of Pure Reason*, B xxx. We may note that *most* of the world’s religious traditions involve “faith” of a projective or postulational kind that is akin to Kant’s—i.e. they involve assumptions that are not self-verifying in the continuum of human experience and communication. So Hegel’s critical sublation of God’s “promises” does not only touch the three “religions of the Book” that are founded on a supposedly gratuitous “revelation.”

7. It comes naturally to me (in our world of physical “relativity”) to say “continuous process.” The words “in the beginning” probably had a certain *empirical* absoluteness in Hegel’s

Newton-dominated culture. But the “beginning” with “Force and Understanding” is a logical not an empirical matter regardless of whether “God plays dice with the Universe” or not; and so is the necessary revisability of the interpretation.

8. The absolute *repetition* of Reason in the Manifest Religion is laid out in the commentary on paragraph 787. I may not always have made the best possible identifications; but I hope to have succeeded well enough to prove that the “repetition” really is present.

9. Thus in a metaphysical or ontological sense, all of Natural Religion is Unhappy Consciousness. But except for the reconciled Unhappy Consciousness this comment has no relevancy because the ontological distinction between *self* and *other* has not yet been made. For the reconciled Unhappy Consciousness both Natural Religion and the Art-Religion are idolatrous (and hence eternally “unhappy” or damned) because it *has* made this distinction absolutely, and has seen the Other overcome it.

10. This circular or reciprocal syllogism expresses the structure of the whole chapter also: God comes down from the Divine Light, through the statue, to singular self-consciousness; and the singular sense-certainty that *It is* ascends through self-assertion, to the rational certainty that the Community is in me and vice versa.

11. Hegel did have an earlier draft of sorts (see *Pilgrimage of Reason*, chapter 3, note 54). For the conditions under which this chapter was written see letter 95 to Schelling of 1 May 1807 (Hoffmeister, I, 161–162); and for the reasons why Hegel was under pressure to complete his manuscript before a deadline that was already upon him, see *Pilgrimage*, Introduction, 8–9.

12. It is Faith itself that posits the experiential presupposition as *historic* (which in its *bounding* aspects it rationally *cannot* be, so that the free self-creation of the Spirit “out of Nothing” verifies itself); and the logical presupposition transforms itself *for* Faith into the reconciled acceptance of *unbelief*—so that the transition to Absolute Knowing verifies itself as necessary (and the presupposition-relations develop into presuppositionlessness).

13. The three moments are well interpreted in a secular philosophical way by J. L. Esposito (1983). But he does not deal with our problem of the transition from the Manifest Religion as one of methodic continuity.

14. For the connection between Conscience and Absolute Knowing see J. E. Russon (1991). Because of the disruption of the religious consciousness, we are conscious of the Kingdom of God as both “now” (in forgiveness) and “never” (in either the active or the judging consciousness). To exhibit the sense in which the “now” is absolute is the task of Absolute Knowing. So the simple opposition that M. Westphal sets up between Hegel and Tillich at the level of *Religion* (1972 = 1992, chapter 13) is a mistake. At the level of Religion Hegel is only opposed to Tillich in the way that he is to himself. At the level of Philosophy he appears to be opposed to Tillich at the level of Religion. But the appearance is misleading.

15. Even B. M. Reardon concedes too much to Kojève when he says “the real *Aufhebung* of religion, according to [Hegel’s] thinking, is not metaphysics but history itself” (1985, 55). For “metaphysics” we should read “the *actual* concept within which all of our experience—and especially our recollective experience of our religious history—is embraced.”

“Estrangement” remains a necessary moment of the absolute community (cf. F. Wagner, 1971, 176–177 and A. K. Min, 1974, 89–93). To call it a state of “satisfaction” is *misguided* in Kojève’s unitarian-political sense (the “universal homogeneous State”)—and somewhat Pickwickian in Pippin’s sense. It is not the mystical harmony of the song in Browning’s “Pippa passes”; and the philosophical awareness that “this is how things ought to be because

this is how they have to be (and the only way they can be) is consistent with an immense range of feeling-states (from Young Rameau through Mother Teresa to J. Royce). If we do “become God” (K. Schrader-Klebert, 1969, 94–95) it is only by indulging ourselves in the “moral holiday” of W. James.

16. It is not clear that this is *all* that Hegel means by his “*theils . . . theils . . .*” He may mean also that an important part of the evolution both of singular consciousness and of the *Weltgeist* took place before the advent of Christianity (and, in particular, before the Reformation). But this point is so obvious that it does not require commentary or explanation.

17. “Turning back” is always an option for consciousness. That is how each position makes itself into a stably closed circle. But *that* choice expresses the desire *not* to go forwards.

18. I borrow this phrase from M. Rosen, *Hegel's Dialectic and its Criticism*, Cambridge, C.U.P. 1982, 179. But as far as I am concerned Rosen's case against Hegel is “not proven”; and if history *can* be “comprehended,” then Hegel is *not guilty*. (For assessment of M. Rosen's work, the reviews by W. De Vries [1984] and S. Houlgate [1983, 1985] can be recommended.)

19. B. Yack (1986, 219–223) has understood *political* reconciliation correctly. Philosophy overcomes the dissatisfactions of reflective enlightenment—and those of romantic nostalgia. Hegel had suffered from both—cf. D. Henrich in M. Inwood (1985, 199–207). Philosophical reconciliation leads us to abandon revolutionary *methods* in politics, and obliges us to recognize revolutionary goals as unachievable. But we can continue to be committed *reformers* or *conservatives* on particular social issues. Philosophy does not change modern *Christian* politics. (Compare also M. Hardimon, 1994).

In “consciousness,” at least, we have made noteworthy advances with respect to the “natural differences” of race and sex. But our progress has been accompanied by some terrible regresses. “Absolute knowing” teaches us that it is folly to suppose that moral progress can be measured in any *absolute* way. It would be absurd for a Hegelian to suppose that we are “wiser” than Hegel. We simply have our own world to interpret as well as we can. “Absolute Knowing” has no use for comparatives.

20. In the terms of the Bacchic revel image, Absolute Knowing is not one of the participants in the revel. But it has its *Gestalt* aspect, because it is ourselves as the observers of the revel—and we are an embodied community. We become logicians by ceasing to observe, by closing our eyes and beginning to think purely. K. Schrader-Klebert (1969) is mistaken in her criticism of Hegel, because she ascribes to him a goal which (he agrees) is unachievable. His philosophy is “without presuppositions” because it moves *thoughtfully* from the real philosophical observer to the absolute comprehension of what philosophical observation is—and so to pure thinking (cf. S. Houlgate, 1986, 28–30).

S. B. Smith (1989, 177) describes absolute knowledge as if it were Aristotle's “best and most complete virtue” (comprehending all others). But in its moral aspect, it is only an adequate *concept* of the good life. Living is still to do; and there is an important sense in which “the I” will *never* “find in itself expressed *all* the capacities and attributes of the species. The *philosophical* “end of history” is *not* the land of heart's desire, with nothing noble left to do. Nor is it the world of Nietzsche's “last man” or of Kojève's “homogeneous State.”

Since Absolute Knowing is a *Gestalt*, there is no doubt that D. P. Verene (1985, 15–18 etc.) is right that it involves the subject-object structure of consciousness. W. D. Ludwig (1989, 1992) has developed this “unity of incommensurables” thesis systematically; compare also K. Düsing (1976, 205–208). But it is also clear that the “pure thinking” of the *Logic* is an “absolute knowing” that is no longer *supposed* to have this structure. The appalling diffi-

culty of writing about Hegel's *Logic* in the normal language of "consciousness" springs from this. Logic involves an "angelic" intelligence—but we are only "fallen angels" at best. We understand one another logically only when that is our *paramount* concern. W. Maker is mistaken when he says that the "absolute knowing" of the *Phenomenology* is "no knowing at all" (1981, 390); but right when he says that "consciousness is not an absolute limit beyond which reason cannot extend" (395). If he and Ludwig think that they disagree, they are both mistaken. (Maker [1990] has given a clear account of the purely negative conception of the purpose of the *Phenomenology*. This is very acutely criticized by G. Vassilacopoulos (Ph.D. thesis, 1993, 88–89, n. 4).

21. Compare the interpretation given by G. Varnier (1990, 292–293). There is an interesting debate in *The Owl of Minerva* between S. Houlgate (1991 and 1993) and J. C. Flay (1993) about "Hegel's metaphysics" (and whether he is a "refined Kantian," with a problematical "thing in itself" in the background). It appears to me that Houlgate must (logically) be in the right on this issue, because the transition to the *Logic* involves a complete sublation of the "standpoint of consciousness" (not the qualified maintenance of it that Flay appears to me to be ascribing to Hegel). As I see it, Houlgate ought to reply to Flay, that the supposed "possibility" of a being that is beyond our capacity of thought is a *meaningless* possibility, a thought that *fails*; and what is *meaningless* cannot *be* (because the assertion that it *is* is meaningless likewise). But I think also that Flay's claim that "the categories of Hegel's metaphysics . . . belong to, derive from, and ground the *relata* themselves *qua relata*, whether these be thoughts alone, things alone, or thoughts and things" (1993, 152) is valid.

22. *G.W.* VIII, 263, lines 16–17; Rauch, 160. Philosophy is the "for itself" aspect of the "Spirit that subsists in and for itself" distinguished into its moments; so Plato's *Republic* is the proper place to look for the "distinct moment" of the knowing of Spirit as "Substance." This is confirmed by Hegel's insistence, in the Real Philosophy of 1805, that it is not to be read as a Utopia. I am not sure exactly what Hegel meant to say in his marginal note in *G.W.* VIII, 263, lines 25–26: nicht die platonische Republik ist nicht ausführbar . . . But his *main* point—in this addition made while he was writing the *Phenomenology*—was that Plato's *Republic* was *not* an abstract ideal (of the Fichtean type) but a comprehension of the inner logic of the actual *polis* ("den Staat seiner Zeit in seinem Innern gefasst"). So if we read: "<wir haben> nicht die platonische Republik, ist nicht ausführbar u.s.w." the whole addition makes sense as an exposition of this thesis. Other hypotheses are possible—perhaps the first *nicht* should have been crossed out. But I am certain, at least, that Rauch's interpretation (160n.) is mistaken.)

23. For a valuable commentary on this dictum in the context of Hegel's "system" see John Burbidge (1973 or 1992, chapter VIII). As the eternal presence of what "has been," time is the sphere of *essence*—cf. J. C. Flay (1989) who brings a number of important passages from Hegel's other works together in an insight-producing way. M. B. Okrent (1980, 1982) is also helpful. P. C. Rasmussen (1972) is too much influenced by Findlay. (See further *Pilgrimage* pp. 246ff.

24. The deductive (predictive) control of experience is the *result* of our *inductive* experience—cf. P. A. Simpson (forthcoming, chapter 5, section 2, especially the reference to Marx at note 17). Joan Stambaugh (1974, 89) has articulated why many interpreters—Loewenberg, Marx and herself for three examples—find the arrival of "*absolute knowing*" as the "comprehension of time" so incomprehensible. She thinks that Hegel must *stop* time in order to comprehend it. The concept of "*absolute teleology*" in the *Logic* should teach her why this not merely unnecessary, but absurd (in Hegel's view as well as hers). I agree with

M. E. Williams (1970, 161) that the sublation of time is identical with its *structuring*; but since I take “absolute teleology” to be its *structure* I do not think we ought to say that the comprehended concept contains “no *nisus* towards futurity” (compare the commentary on par. 787 above).

25. As the note in the Critical Edition shows, the formulas Hegel quotes here come from the thought-context of the Moral World-View. It is the “experience” of the Beautiful Soul that is at once the most comprehensive and the most subjective.

26. Hegel uses *Gemeine* not *Gemeinde*, apparently to distinguish now the *absolutely* spiritual community, as opposed to the “actual world” of political authority. He also uses *Realisierung* instead of *Wirklichkeit* for the final transformation of the religious *Vorstellung* into the Concept. *Wirklichkeit* is the finite actuality created (or affected) by what we *do*. (Compare chapter 12, note 29 above.)

27. See Hegel’s *Lectures on the History of Philosophy, Vorlesungen*, Band 9, 1–16, 20–32 for a fuller account of his view of early Medieval Christianity—Brown, III, 17–35, 40–51. (Note that it is “the Lordship of the Son.”)

28. Thus the “Lichtwesen” does *become* Yahweh. But only when he is *identified* with the Nature that he (Mosaicly speaking) “creates”; and even if we accept Spinoza’s distinction between N. *naturans* and N. *naturata* as a logical concept of “creation,” Yahweh cannot be identified as the *primitive* shape of the “Light Essence.”

29. Novalis, fragment. By treating Spinoza’s thought as the resurgence of “the Light-Essence” Hegel does justice both to Spinoza’s “god-intoxication” and to the general accusation of “atheism.” His turning away from the theology of Incarnation back to the conception of God as universally (or “immediately”) all in all, necessarily has both aspects.

Critics of Hegel’s later treatment of Spinoza (like J. B. McMinn, 1959–60, and E. Shmueli, 1970) are for the most part defending an interpretation of Spinoza towards which the younger Hegel was himself more partial—or at least ambivalent. For a moderate—though perhaps too Romantic—mediation of the dispute see R. K. Williamson (1984, 234–249).

30. This both explains, and is confirmed by, his evident presence in the discussion of the “law of Individuality (pars. 304–308) and in “Individuality that is real in and for itself.”

31. Of course, the knowledge of our mortality, the certainty that our own time is limited, makes this “natural.” (On the sublation of time see P.-J. Labarrière [1979 in 1986, 149–157; and 1981 in 1986, 317–334]. D. J. Schmidt [1988, 55–62] also has an interesting discussion of Hegel’s concept of time—and Heidegger’s mistaken critique of it.)

32. As Hegel has remarked a little bit earlier, Spinoza’s “extension” is at least a “pure concept”. It is obvious that this passage in Hegel’s text should be read in the light of his more extended discussions of “schematizing formalism” in the Preface. I have therefore interpreted it in accordance with my exposition of the relevant paragraphs there (pars. 14–16, 50–53). According to my view, Schelling himself is not the target of attack (see H.S. Harris, 1987 and 1989). But it makes little difference to the philosophical argument whether I am right, or whether *Schelling’s* Identity Philosophy is attacked here (not just Reinhold and Bardili on one side, and epigones of Schelling like Görres and Wagner on the other). The interesting thing on either view is that Schelling is given no credit here for any positive contribution. The *Phenomenology* is presented as the concrete fulfilment of Fichte’s “*Ich = Ich*.” (In my own view, the sense of having committed an injustice to the “Identity Philosophy” *here*—because of the urgent need to finish his manuscript—was one of the motives that caused Hegel to return to the whole topic at his leisure in the *Preface*. I regard the opening sentence

of par. 14 as crucial. But it remains true, when all is said and done, that Hegel cannot *specify* what he owes to the Identity Philosophy; after almost ten years he turned away from both Hölderlin and Schelling, back to the problem of “Self-Consciousness” as he initially posed it—in *Fichtean* terms—in the *First System-Programme* [end of 1796].)

33. Compare the first Lexicon article about Hegel, in which the biographical data almost certainly stem from Hegel himself (*Konversations-Lexicon* of 1824; see F. Nicolin, 1972). This is cited and discussed in the Introduction to *Pilgrimage*.

34. The logical sequence of “Unhappy Consciousness,” “Faith,” “Self-Conscious Religion” is, in all probability, a lineal descendant, and concrete “result” of this general theory.

35. I have argued for this view in more detail in H. S. Harris (1983 and 1990).

36. Compare Rosenkranz, 11 (and *Toward the Sunlight*, 47–48, 56).

37. Compare *Night Thoughts*, chapter I.

38. Hiroshima is to some extent comprehensible within the mantle of “forgiveness,” since we might say, as Jesus did, “Father forgive them, for they know not what they do.” But if we are willing to say that, it only makes the full horror of Nagasaki more evident.

39. This seems to be the best place to say something briefly about two “logical architectonic” views of the *Phenomenology*. J. Heinrichs (1974) took the *Logic and Metaphysics* of 1804/1805 for the logical skeleton of the book. This view (which becomes implausible already by the time we reach Stoicism) breaks down completely at the great *ricorso* of chapter VII. Here Heinrichs has to import logical ideas that Hegel developed (or at least expressed) only much later. (For a brief refutation of Heinrich’s thesis see J. H. Trede, 1976.)

Retrojection of the later logic is the fundamental fault of C.-A. Scheier (1980) also. In his cathedral of thought, chapter VII falls into place nicely. But, gothic though it may be, the *Phenomenology* is not a cathedral. It is, first of all, a serial development. After we have appreciated the logic of the series properly, we can begin to examine it architectonically; and when we do that, we should either begin from the structure that the author imposed on it (in his belated Table of Contents), or else admit that we are uncovering something that he did not know was there.

40. Thus when some part of its discursive course needs to be revised—as for instance the early modern concept of “causality” has to be radically transformed in order to deal with relativity—what is absolutely necessary is that we must be able to find our way logically backwards and forwards between the older concept and the newer one (just as quantum mechanics can exhibit Newtonian mechanics as a special case). It is certain that Hegel did not envisage any actual “sublation” of the celestial and finite mechanics of Newton. He thought of Nature as “the Unchangeable” in the sempiternal Aristotelian sense. But he knew both that the concept had *evolved* in our Western tradition, and that in other cultural traditions there were different “Ideas of Nature.” So he framed his logical theory to comprehend these evolutionary differences. Moreover, he knew that his own “comprehension” of Nature was not perfect even with respect to the science of his own time. So he actually *expected* some revisions in his logic. See the *Science of Logic*, *G.W.* XXI, 38, lines 17–25; Miller, 54; compare *G.W.* XI, 25, lines 18–26 for the text of 1812.

41. I dislike arguing about the status of Hegelian logic as “ontology” (because that term creates in me the subjective impression of eternal stasis rather than motion). But I must agree with writers like A. White (1983) and S. Houlgate (1991) that the *Logic* should be regarded as Hegel’s “ontology” (cf. J. H. Trede, 1975). What R. D. Winfield’s denial of its status as ontology (e.g. 1989, 137) signifies I have not understood. But since I agree with

Houlgate's view (1986, chapters 4 and 5) that Hegel is a *critic* of "metaphysics," it is quite possible that all three of us would agree if we did achieve understanding.

42. While he was writing the *Science of Logic*, Hegel was regularly teaching "logic" to students of fifteen or sixteen at Nuremberg. This was the apprenticeship from which the effort to write the *Encyclopedia Logic* sprang.

43. Even in the *Science of Logic* we find Hegel speaking of logic as "the thought of God before the creation of Nature and the finite Spirit" (*G.W.* XI, 21, lines 18–21 or XXI, 34, lines 7–11; Miller, 50). At that point he was presupposing that his serious audience would study the *Phenomenology*, so that they would know what "God" and "creation" refer to in philosophically comprehended experience; and how the "Before" of the Concept is just as much within the "Now" of experience, as the Now is within the Before.

When he told his *Encyclopedia* audience that every logical Concept in its simplicity was a name of God, on the other hand, he was helping them to envisage the project in the best terms available to them at the beginning. He cannot have felt confident that they would understand what was happening to "God" when they reached "Absolute Knowledge" at the end; and he must have regarded the inevitable emergence of a *theological* interpretation of his "System" with resignation. In his eyes it was, at least, a great step forward from the Enlightened nominalist view of the world; and as long as the thesis of "Absolute Knowledge" was grasped *at all*, there was the logical certainty that the "theology" would *eventually* transform itself into a properly conceptual form. For what seems to me an appropriate contemporary reading of Hegel's Logic, see J. McCumber (1993).

44. My concern here is only with the *logical* error of the "Left" (for historical—i.e. *phenomenological*—justice to them see J. E. Toews [1981], H. Mah [1990] and M. Hardimon [1992 and 1994]). Through the Hegelian theory of experience, we comprehend why we cannot help being moral agents; and it is at least plausible to argue that when we comprehend "substantial subjectivity" our moral perspective becomes a socially responsible one—that is to say, self-conscious *solidarity* becomes a fundamental moral value for us. We are then bound to want to articulate that solidarity as *logically* as possible (that is, with as much communally rational "self-consciousness" as we can achieve). But we must never call this logical spirit "Science" while it is in action, since it is axiomatic that "action" involves a conflict of *ideologies*. Our own "absolute right of self-consciousness" is bound to be just as ideological as the "divine right" of the Substance that opposes it. It is just one side of the *Gegensatz* that it has recognized and defined. Only the reconciliation, when it comes, will be (potentially, at least) observably "real"; and it will not be exactly what our alienated pure insight anticipates when it does arrive. (One of the main uses of "absolute knowledge" is precisely to teach us what sorts of knowledge are *not* "absolute"—and to provide us with a way of showing just *how* and *why* they are not absolute.)

45. Croce's Philosophy of Spirit includes its own "Logic," of course. But it is not a logical theory of the right kind.

46. But this did not bother Findlay, for example, who greeted Rosen's critique with friendly appreciation, as a kind of insight of the blind (see J. N. Findlay, 1983); and Bosanquet was not the only "Hegelian" of an older generation who thought that a moment of vision, not unlike a "conversion experience," was necessary in order to "become a Hegelian." To me, this whole attitude appears quite absurdly "un-Hegelian." But who made *me* the judge?

47. Reflecting upon the logical relation of the *Lichtwesen* to Spinoza's concept of Substance (in the context of the thesis that every Religion expresses *all* moments of the Spirit) could

easily have made him realize that making a *historical* parallel between Religion and philosophy would involve an intellectual arrogance equal to that of Lucifer. (Also, one does not have to think about Religion very long, to realize that there are important religions that do not belong to the phenomenology of the Manifest Religion; similarly anyone who begins to do Logic soon realizes that no purely rational limit can be set to the dialectical evolution of the Concept in its detailed extension.)

48. The best constructive attempt to deal with this problem is in the book and articles of H. F. Fulda (1965, 1973). But I agree mainly with O. Pöggeler's sceptical criticisms of Fulda's thesis. See Pöggeler (1973) and Fulda (1973).

49. Thus the *Phenomenology* is the "first science" by any criterion; and the *Logic* is properly the *mediating* science between "consciousness" and "real philosophy." But Hegel would say that "Logic" is "first"; and the arguments of W. Rowe (1986) show how the circularity of "Science" can be used to deny or qualify all of these claims.

50. Compare the Real Philosophy of 1805, *G.W.* VIII, 3–10. (It seems to me that the contention of K. Schrader-Klebert [1969, 12] that Hegel's beginning does not still stand within the system is plainly mistaken.)

51. This is not a "presupposition" that violates Hegel's programmatic intention to produce a "presuppositionless" philosophy. It only says that philosophy is the theory of *life* as an intelligible whole. The theory involves organizing all of the "praxical presuppositions" of life (Flay, 1984) into a self-critical system. Life itself is an open infinite river (not a "whole"). So Flay's criticism of M. Leske (1978) is correct; and the *Phenomenology* shows why it *does* make sense to keep on insisting on the many ways in which life does not "make sense" (*pace* Flay's quote from *Toward the Sunlight*—see 1984, 410, n. 7).

52. E. E. Harris (1982, 135–136) points out that *Gestalt der Erinnerung* can just as easily be genitive as dative; and that in that case, a traditionally theistic interpretation is possible. I am certain that the interpretation is upside down, but there is no denying the grammatical point.

53. Surely Hegel means us to read this proto-Heideggerian hyphenation in a punning fashion: it is the "He-Innering" of the Logos that is the *creation process* of the Spirit. For the fulfilment of the transition from the all-creative Logos to the Spirit, *our* self-conscious remembering is crucially necessary. Compare, in this connection, the comment of T. W. Adorno (1993, 56) cited in *Pilgrimage*, chapter 1, note 136. If this interpretation of Hegelian "recollection" is correct then D. Jähnig (1971, 69) is wrong to say that Hegel's system results in an "eschatological-teleological nihilism" which sets aside actual history and "sacrifices the human present." Various prophetic *misinterpretations* of the Romantic "philosophies of history" have contributed to "sacrifices" of this type in our century. But Hegel's *Phenomenology* (at least) is innocent.

54. T. Bahti (1992, 80–91) wants us to see *Erinnerung* on the analogy of a community that eats and digests its fellows. But spiritual community is not like that at all. As resting upon a forgiveness relation, Hegelian recollection expresses the philosophical meaning of "resurrection into eternal life." One may wish to claim that the metaphor is misleading in some way. But one should not misrepresent what is claimed. Recollection "lets things *be*." (There are sound *logical* reasons why Hegel's brief discussion of cannibalism concentrates on the moral *act* of eating a fellow-human, and ignores the natural process of digestion.)

55. Or more adequately in the last part of the "System of Science" envisaged as the proper complement of the *Phenomenology*, but never completely prepared for the printer. Only

"Absolute Spirit" was fully worked out (in the great lecture series on Art, Religion and Philosophy).

56. The transition is well summed up by R. Norman (1976, 132): "History . . . henceforth simply coincides with the fully self-conscious activity of human reason." (It is the *content* of our own "experience" that we repossess—and that keeps growing. But we don't have to go round the circle again and again. We *may* read Hegel again—R. B. Haldane is reputed to have read the *Phenomenology* forty times—but we are never trapped in the system, as Feuerbach jokingly suggested one could be [1972, 62]. The problem raised by the fact that the "need of philosophy" continues—and so the procession must go on—is well aired by H. Kimmeler [1968/1969 = 1990, 301–312].)

It is the *History of Philosophy* lectures, not the *Philosophy of World History* lectures that are evoked in this last paragraph. All attempts at "World History" are *philosophical*, in the sense that we are bound to ask "Why is the author writing this?" It is no surprise to learn that Rosalind Toynbee called her husband's mammoth *Study of History* "the nonsense-book." Hegel's *Philosophy of World History* had already become a terrifying example of a "nonsense book" when Toynbee began. Within the system, it had a function, and it performed it adequately (for its time). Outside of that context it is absurd (and it always was so). The *Phenomenology* shows us why each of us must "recollect" our world, as well as we can, if we want to be *humanly* self-conscious. But (*pace* C. Butler, 1989) we shall not be helped by a more Hegelian Toynbee.

57. For an interesting discussion of Hegel's earlier use of this image see S. Crites (1982). Ernst Bloch offers a humanistic translation, calling this climax "a 'panhistorical harvest festival.'" The lives of living humans are the grapes that have been pressed for the wine. A. Heller avoids both the "tragic" and the "divinely comic" view, saying that "Hegel writes traditional novels. The *Phenomenology of Spirit* ends, after all, with the consummation of the marriage between the Absolute Spirit and History" (A. Heller, 1993, 67).

58. E.-D. Yon (1976, 553) speaks of the disclosing revelation of Substance which *conceals* its selfhood (par. 801) as a "return to the being-there that is immediate." But ordinary sense-certainty has the same aspect when we interpret it within the concept of "absolute knowing." For now the "whole" which was present in consciousness, though uncomprehended (par. 801) has been conceptually comprehended. (Cf. also D. E. Christensen, 1974.)

59. "The *Phenomenology* is, as M. H. Abrams has quite properly pointed out, a secular theodicy in which every truth the Notion loses along the way is recovered in the final accounting" (S. W. Melville, 1986, 42—cf. M. H. Abrams, 1971, 225–237). For *Unphilosophie* see the Introduction to the *Critical Journal* (G.W. IV, 119–120, 127–128; Di Giovanni and Harris, 276–278, 285–286).

60. "Common sense" can be "instinctively rational" in the post-religious community, just as it was earlier. Critics like G. P. Cave (1979, 26–29) fail to take account of the fact that speculative philosophy is the "being-for-itself" of the *community*. One can be a member of the community without being a *philosopher*.

61. The impossibility of war in modern circumstances means that Hegelians are now bound to think *against* Hegel himself on this issue—cf. E. E. Harris (1980). But against *him*, Hegelians must argue that "thinking for the future" is not "philosophy." Properly speaking, we have to leave the world to solve its own problems. We must not speak confidently of "sovereign power" (or of a *Weltgericht*). The Hegelian theory will continue to be a radical critique of utopian dreams like that of Dante (cf. H. Paolucci, 1980) and J. C. Flay (1980).

W. Sünkel (1988) argues that the seed of salvation is in economic developments, and the formation of supra-national blocs, rather than in the advance of international law. But why not in both together? (He is on good Hegelian ground in denying that organizations like the United Nations alone can save us.)

T. F. Geraets (1981/1982, 201) says that Hegel's talk of the "Völkergeist" is now "pure mythology, worse even than the cosmopolitanism or the world-republic which Hegel cast out as 'abstraction.'" Both categories are mythic certainly. But they are not equally "abstract." *Concreteness* is not a matter of "better" and "worse."

62. According to my interpretation what Flay calls the "single referent for totality and intelligibility" (1984, 254 etc.) either *logically must* exist or *logically cannot* exist (depending on how one interprets the reference). If the reference is to an intelligible *totality of categories* for the interpretation of life then it *must* exist because it has demonstrated itself in the *circle* of experience; if, on the other hand, the reference is to a supposedly real totality of life itself, then it *cannot* exist. The only way human life could be "totalized" would be through the death of the race as a whole. That is quite possible, but it simply abolishes the positive sense of "the world" (as a totality of *sense-making*) and leaves us to contemplate the *negative* identity of "intelligibility and totality." That outcome shows us the ultimate meaning both of the proposition "life as a whole does not make sense" and of the proposition that "it does not make sense to assert that the world may not ultimately make sense." Philosophical logic leaves us with both propositions and does not decide between them. Both of them "make perfect sense" (compare note 51 above).

Ritornello

1. *In Vino Veritas: Truth in the Round of Life*

Throughout this commentary we have concentrated upon the material concept of “Experience.” The principal object has been to see how far the “appearing of Science” can be followed as a logical process. According to Hegel’s programme, the *actual* concept of human “experience” can be shown to unfold (or develop) in a sequence of materially embodied *shapes*. By returning finally to its own natural attitude (and its spontaneous beginning in sense-consciousness), the final shape of Absolute Knowing consciously repossesses all of the previous “shapes.” The whole series is supposed to be cumulative. Each link presupposes the earlier ones; but as a separate “link” it is quite unaware of this. Only the final Shape—the Absolute Knowing that *we* have been from the first, and which has finally come to perfect maturity in our coincidence with the evolving consciousness that we have been observing—is different from the earlier links in its recollective awareness of all the stages by which it has come to be.

The natural and necessary task that imposes itself upon us in conclusion, therefore, is the *conceptual* recollection of what the earlier shapes forgot. The shape of Absolute Knowing is the self-knowledge of the Concept of Human Experience itself, the recollection of all of its developmental phases as logical moments in the development of the Concept. As *recollective* this final phase of Experience is itself a “shape of Consciousness”; indeed, it is the richest of all the shapes. It is the whole dance of life (with the music of the spheres for its orchestral background). Nothing now is forgotten, omitted or neglected. But this cumulative “shape” is different from all of the dancing shapes in the ring, precisely because it remembers them all, whereas their individuality depends upon their forgetting one another. We can think of this last shape as being “in the ring” only if we think of it as being “in the centre”; and that means that as a dancing shape it is not “in the ring” at all. Its motion can only be a simple spinning revolution on the spot.

This is the best way of understanding the paradox that Absolute Knowing both is, and is not, a “shape of consciousness.” The philosopher is a conscious being like any other; but her conscious concern is to get out of the round of life, and into the still centre. This is the place where everything can be seen and remembered—not forgotten necessarily, as one must forget the steps of an old dance when one

assumes a new role in the great round dance itself. In the centre we have spun gently watching each dancer go through the whole cycle of a life-performance, before we stood still for a moment to let the next one come into view.

But now even our self-inhibiting spin is over. The whole circle have passed before us, and we are back with the first one—the never-forgotten shape of the human body and its senses which every dancer has, and which we cannot lose even in our new stillness, sitting with closed eyes, and the dance of life all forgotten. Now we do not want to be in the dance at all, even as the observer who sees it all, and does not have to concentrate her attention on being one part of it. For now we know that we have managed to be the unforgetting observer in the centre, because from first to last we have been the *Concept* of the whole. Always we have been the purely intellectual awareness of a Being that is no longer sensible, a Being that already *has been* in its sensible mode of reality, and *now essentially is*. Thus far we have let it be as “experience”; that is to say we have *resurrected* it in our imagination. But now we want to know what *we* have been doing as pure intelligence; and with that objective we cease to be a “shape of consciousness” altogether. We are now the thinking Concept of Self-Consciousness aiming to say what it essentially is (in a strictly conceptual, or logical, language).

In the first sentence of his Introduction Hegel laid it down that the *Sache selbst* for the philosopher is “the actual cognition of what in truth is” (par. 73). Thus the thinking Concept of Human Experience, which we have become, is for Hegel “what in truth is.” The form of words itself tells us that the concept of Truth which we are seeking, is the “ontological truth,” the truth about “what is ultimately real.” But the result of our quest is paradoxical, because our actual cognition turns out to be “what really is.” The ontological quest has turned itself into the project of forming a comprehensive concept of *Experience*. If we want to understand what has happened, it will be best to examine the whole course of the argument as an inquiry into the *experience* of the concept of “truth,” without the prejudice created by philosophical modifiers. The driving desire of our progress has been to formulate the concept within which our lives can be *rightly* oriented, organized, and lived. This is a desire that we *do* have; and we need to know “what truly *is*” for the sake of it; so the concept of “truth as correctness”—which Hegel dismisses rather contemptuously when he presents his *Logic* to students—acquires, in this formulation of the problem, the focal position to which its uncontroversial character in the world of commonsense experience entitles it.

Let us reexamine our odyssey now therefore *formally* as a quest for the concept of “the truth of life.” What have we learned about the logical structure of our world, and of our experience in it? We began by trying to formulate the concept of “the world” itself, as the fixed stage or environment of all “experience”; and, of course, we began with the concept of “the world” that has to be there, already formed and readily available in our minds, before we can even conceive the project of formulating it “logically.” Critical reflection tells us, at once, that this unreflective concept itself is (and must be) the result of a historical formation-process; historical knowledge—or even the “unprejudiced” observation of some fundamental

disagreements with our neighbors—can soon teach us that the “world-concept” *has been* different in earlier times, and *can be* different in other places. We made a conscious decision not to worry about that, but to begin where we actually find ourselves, and go on with the project of formulating our world-concept, as our logical capacity itself appeared to dictate. What we were seeking clarified itself for us as we went; but the process of clarification could only come to a conclusion that was self-certifying as final, because the philosophical *form* of that final concept was present in our world from the first. We *knew* that it was there; but, as formulated by Fichte and Schelling, it appeared to be in conflict not only with all ordinary interpretations of “experience,” but with itself. And the ideal life of the Beautiful Soul—which proved to be the key to a logical reconciliation of the conflict—appeared to be nothing more than a subjective Utopian fantasy.

In the course of our logical journey everything came together; and the apparent contradictions did not disappear; but they were mediated out of the status of simple “realities” into the overall structure of a logical system of appearance. The “truth of life” turned out to have many “shapes”; but in the end, we have found that the speculative interpretation of Kant developed by Fichte and Schelling provides a conceptual framework for making harmonious sense of them all; and we ourselves, by incorporating the ontological and theological tradition for which the Beautiful Soul formed the climax, have given that speculative theory a completely new turn as a “philosophy of experience.”

We began with the world-concept of Frau Bauer. Here we have “truths” of the most familiar sort: “There are six cows in Frau Bauer’s cowyard, among which she says that Lisa is the best.” But already the last part of the sentence has a debatable truth-status. Her husband Georg (his name, like our philosopher’s, only means Bauer over again) may have plausible grounds for arguing that the “spotted one” is really better; so this world of truth is really in the eye of the beholder. Still, the *number* of cows we can determine beyond debate by pointing at them one by one. But then, not only is much that is of the first importance left indefinite by this pointing criterion; what is absolutely certain is that nothing in Frau Bauer’s world that can be pointed at, is one of its abidingly “substantial” components. Day and Night, Sun, Moon and stars, the cycle of the seasons, these are the “substances” that can be pointed out. The cows, their owners, and the children who drive them to pasture will die; and (at best) only their place in the Earth will then be pointed at.

But there will still be cows, farmers and children. The *kinds* are substantial surely? When we take the world to be constituted by “kinds,” the cycling alternation of day and night takes on a deeper significance. For now we are forced to recognize that what “truly is in itself,” only is “for another.” A simple “substance” such as salt arises from the interaction of two seeming things that are not “things” at all; and it is only cognitively recognized in a process of interaction in which it is dissolved. Experience reveals how the world of “things” is really the manifestation of a balance of “forces,” which are in themselves quite imperceptible. The whole world of Perception is only a middle term between this Being-in-itself, and the essential order of natural law which exists for our thought. And even in this world-

view, the activity of interpreting that brings this thought-world to consciousness, is what is still left out; when we relate the two worlds of perceptual consciousness and thought with an appropriate awareness of the fundamental role of this activity, the truth-concept of the system of "natural necessity" inverts itself. "What truly is," after all, is a free activity which interprets itself as a system of necessary laws.

The story of "Truth as perfect freedom" is long and complex; and there is a difficulty at the very beginning, because what has so far come to birth is "the Infinite," or the Divine Life as an *object*. How our conceptual activity of interpretation can be identical with this infinity of Life is not obvious. The Infinite appears to be what is absolutely *other* than our cognition, what is cut off from us. But we have already come to see in our cognition of it that what we share in is its *life*. So we do not have to pass straight on to the religious level at which that "otherness" is accepted as a simple "fact of consciousness." We can follow the path marked out by our finite participation in the life of the whole. We know that we are somehow the junction-point of finite and infinite life, of infinite and finite consciousness. The modern philosophy of subjectivity has enabled us to comprehend that, as scientific knowers, we live and move within the infinity of the absolute Self. So we can "stand in for the Concept" now, not as the Concept of Nature, but as the Concept of Freedom. We can make a transition that no one before Kant and Fichte could have made; and Schelling's philosophy of Nature is what enables us to make it correctly. We watch the Infinite order of nature differentiate itself into the form of life that is its "instinctive" self-consciousness.

Within this instinctive ordering of the sensibly and perceptibly self-conscious whole, the principle of free understanding is conscious of itself as the *proprietor*. The "world-concept" is now that of *ownership*. The world is what is properly *mine*. Even at the level of Sense-Certainty, this ownership-relation was present. The family and the cows belonged to Frau Bauer. Her world of immediate knowledge belonged to her (and to the neighbors who were hers). But that ownership applied only to the finite "byplay" of her consciousness. In absolute terms she was aware of herself and all her things as "belonging" to an inexorable fate (which she calls "God," but which is not within the range of her truth-criterion). Our newly-emergent Self-Consciousness *owns* everything absolutely; its truth-concept says simply that "the world is mine." (Only upon this interpretation can the "self" be methodically accepted as the "subject" of the total inversion experienced by Understanding.)

This living concept of World-Ownership learns first that Ownership necessarily differentiates itself into the End and the Means. For there to be a *free* Self-Consciousness at all, there must necessarily be two selves who have consciously agreed to share the true Concept of Life between them; and the truth of any such sharing is necessarily finite. The experience of Lordship reveals that it is servitude to the needs of natural life; and the experience of Servitude brings to light the higher freedom involved in the *labor* of self-formation. But that last lesson can only be picked up when the full story of the truth of Lordship has been followed out. First, in Stoicism, we have the reconciliation of ownership with being owned, through a formal retreat into the realm of purely logical thought. As free thinkers we can disassociate

ourselves from the universal lordship of Life. The Sceptic makes a mockery of this escape, by telling us that what we know absolutely in our thought is just that we know nothing. But by what right can he say that, if he admits to being merely a moment in the play of appearance himself? The two-faced Sceptical position can be consistently maintained only by one who admits that we do have the logical knowledge of the Stoic, but adds that precisely that rationally revealed knowledge is what shows us that we are cut off from actual participation in the world of pure thought. We are given over to the lordship of Death, which marks the limit of our finite existence as finite perceivers.

Now the rational religion enters our story for the first time as the key to our liberation as active (or *actual*) Reason. Our truth-concept at this stage has to be provided by our "Faith." Faith tells us that we are *not* finally cut off from the world of true being; our exclusion is only temporary while we are here in the sensible world. The exclusion will end when this life ends, and we know ourselves "even as also we are known." The self-consciousness that lives and interprets its world by this faith, takes the content of it to be a special revelation of the absolute intelligence in the supersensible world "beyond." But it requires no great insight to see that a Stoic intelligence caught in the toils of a Sceptical world-experience, can only account for the total pattern of its life by postulating the separation of the two worlds of intellect and sense. This separation is already a matter of "experience" for the Understanding; so Stoic free thought is the self-conscious Understanding.

For the moment we have the truth-concept of Faith in its self-estranged form. This world and its life belong to the forces of darkness; access to the community of rational freedom in the Beyond comes by penitent self-abnegation here. It is only when the social world has evolved into a community of equal recognition in religion, that the estranged *Vorstellung* of Reason as Divine Authority can be inverted into the happy consciousness of the Reason that is one with God.

Unlike Faith's recovery of "objectivity" (through social *Bildung*), Reason appears by a logical transformation of the singular consciousness. The liberated shape of Reason must operate at first as the self-conscious Understanding; it *observes* the world as a rational substance. But the living organism in which it recognizes itself now as an instinctive process of self-realization, remains no more than the accidental offspring of a universal life-force that has no fathomable purpose; and when the observing consciousness is turned, by this experience, back towards an introspective observation of its own activity, it is faced by a spectacle of the same kind: a disappearing identity of opposites on one side, and a completely chaotic and contingent multiplicity of "faculties" on the other. In observing the relationship between this inner world and the instinctively self-maintaining organism, Reason is forced to recognize the folly of "operating as Understanding." It makes this discovery when it tries to observe itself as an "object of consciousness."

The Understanding takes "what is" to be "the order of Nature." Observing Reason takes "the order of Nature" to be "itself." But when it tries to "read itself" in its own natural embodiment it has to accept the fact that it is *not* an "observer" but a free activity of self-expression in the world.

The logical middle between the Understanding and Observing Reason was the Unhappy Consciousness, which took “what is” to be “the Will of God.” Reason recognizes its own identity with that Divine Will, and so overcomes its “estrangement” from “what truly is.” But the identification is in the activity of theoretical cognition only; the “Will of God” as *will*, becomes a vanishing “unknown.” When Reason identifies itself as the active will that makes its own world it faces a similar difficulty. Now it cannot *say* “what is” at all, because as a subjective activity it is itself nothing substantial. But it is now in a position to *discover* the world that truly is its own substantial reality.

At this point again, just as when we made the transition to “Self-Conscious Life,” we have to be able to recognize the “world-object” of our own cognitive experience. Subjective Reason only encounters the world that it has made, the world that truly is its own objectivity, as a harsh and alien system of “Necessity.” This Necessity brings its desire to “recognize itself in its own other” to tragic defeat; it is actually Reason’s own objective reality as a self-generating and self-maintaining community. When Reason projects its own *ideal* of the community, in opposition to that real community which it takes to be only “natural,” the problem of “what is” as the identity of substantial reality with subjectivity, is for the first time posed in logically reconcilable terms. We now have a conflict between two interpretations of one and the same world. There is the “apparent” world of our “social nature,” the world as it actually is, and the “true” world of Reason, the world subjectified, or as it *ought* to be. From now onwards the problem will be to remove the contradiction, and to make these two worlds coincide.

This appears easier than it is. It seems that we need only to recognize ourselves as the rational beings that we are, and the social world as the real substance that we both constitute and serve. Each of us has a particular function in the economy of the rational substance; but as a concept of the human truth, this will not do, because it brings us back to the universal servitude of life. We are not now serving the needs of the natural masters; but in our rational freedom we are each serving our own needs, and our privately selfish desires. The “common good” is a humbug; and when we abstract from our private lives, and try to express the good of the community as a whole, we find first that we cannot do it; and secondly that we do not need to. It expresses *itself*, and it always has done so for everybody, in the feelings that we call “natural.” In those “natural” feelings of community members, the voice of universal Reason is heard as a *law*. “What ought to be” does coincide with “what actually is” after all; that was known a long time ago.

At this stage the Reason that came forth from the “experience of consciousness” as a principle of subjective freedom, discovers that it has a history as a Substance. The rational individual has completed her history as a “shape of consciousness”; but she ends by returning into that communal substance of Reason which we now recognize to be the substantial objective reality of “the Spirit.” “What truly is in itself” is what is known to be true by and for that substantial communal consciousness (or Spirit). It is “the Spirit” that both *truly is* and *truly knows*.

It turns out, however, that the natural feeling that allots “private life” to women

and “public life” to men, cannot resolve the problem of the “common good” being a humbug. This is because a community of natural *feeling* must of necessity be a finite “thing” in a world of similar things; and the relation of absolute hostility is essential to the maintenance of an immediately felt identification with the public good. Under the stress of this hostility, however, immediate feeling is bound to run to excess, and do violence to the universal feeling of identification with life (the still unconscious shape of the universal community of Reason). When this happens the self-assertive impulse of singular rational freedom can emerge *anywhere* in the community; so there are sure to be radical conflicts between the voluntary loyalties of rational commitment, and the instinctive loyalties of natural kinship. The aesthetically rational consciousness of the community of rationalized feeling presents this logical truth as a conflict between the sexes, but from our absolutely conceptual standpoint we do not need that *Vorstellung*.

Just as the world of perceptual things had to give way to the world of the Understanding, so the world of spiritual things must give way to the world of Reason. This world-shape begins with the truth-concept of a community of singular rational beings defined by the Law. What “truly is” is the Law of Reason; but the dialectic of “what ought to be” with “what is” takes over, because the actual law is only a preponderance of force. Substantial Reason as a universal Concept has the Understanding as its first moment; its evolution to maturity takes place in the self-estranged world of Faith and Reason. Here the Lordship and Bondage relationship of the social substance is worked out. Singular subjects achieve the freedom of spiritual existence, by making themselves over in the service of God. what they gradually create is the actual world of singular Reason in which the “common good” has been seen to be a humbug; and their embodied Rational Category is only the beneficent distributor of wealth. The “truth” of their world is the universal contradiction uttered by Young Rameau. When the estranged shape of their truth is overcome, the gospel of universal Utility is proclaimed, and the identity of God and Nature (Matter) is recognized. But Reason as the World’s Lawgiver is only able to condemn all individual reasoners to death.

The French Revolution is the dawn of our modern “truth of life.” Objective Spirit now passes through its “critical” phase as the “Rational Test of Laws.” In seeking to identify the human truth as the Law of Moral Duty, we discover that the “first relationship” of the Unhappy Consciousness is logically impossible: there cannot *be* a morally rational Divine Judge. Reason, being identical with the freedom of self-realization, cannot operate authoritatively. Thus when we reach the standpoint of Conscience, we have already implicitly sublated the objective substantiality of Spirit as Law.

The final syllogism of Objective Spirit brings us to *social subjectivity* as the Concept in which the opposition of substantial reality and subjective cognition is finally mediated. In the passively Beautiful Soul, the singular Law of the Heart realizes itself as a world; but now, too, because the Holy Moral Will is logically impossible, the conflict of the two successfully separated worlds has to be logically resolved in the universal graciousness of the Spirit: the Law of the Heart becomes the universal

duty of Forgiveness. The mediator in the original *Vorstellung* of Reason as an alien authority, is now recognized to be the divine agency within and between the rational agent and the rational observer universally. These two (not the Lord and the Serf) are the "sides" of Self-Consciousness in the community of *equal* recognition. Every one of us is necessarily "We" as the observer of what she does, and "I" as the agent; and God is the universal Logos of the forgiveness that the sides must exchange.

In this way we come to understand, at last, that "God," the substantial essence of "what is in truth," is simply the community's name for the social subjectivity of our human Reason itself, projected as an "object of consciousness" in the mode of thoughtful *Vorstellung*. What "God" *represents* is ourselves as a universal community in our environment as a totality. "His" knowledge of us is identical with our knowledge of Him, because both are identical with our knowledge of ourselves as a substantial community of individuals.¹

The "experience" of Religion gives this formal Concept its content. We have only been able to formulate the Concept in the first place because the crucial stages of the phenomenology of the religion in which "God became man" and revealed his Will "that all men should be saved" have already taken their place in the sequence of our recollections; so there is no point in going through the truth-concepts of Religion abstractly here. Religion shows us how (at the level of the *community* of cognition) the stages of simple Consciousness appear as the first stages in a genuinely historical sequence; and how "Life" is a separate *Gestalt* from the Understanding even though it is difficult (if not impossible) to envisage it as a singular "*Gestalt* of Consciousness." But because *every* religion incorporates all the moments of experience (more or less distinctly articulated, and not "forgotten" or "sublated") it is invidious to reduce any religious consciousness to a uniquely determinate truth-concept.

Doing that actually violates the absoluteness of the forgiveness-concept upon which our own procedure of neutral observation rests. In order to conceive the absolute community of human experience, we must forgive the necessary and inevitable "finitude" of the singular "shapes"; and by the same token we ought not to thrust finite determinations upon the shapes that are themselves implicitly "infinite." On the contrary, the multiplicity of "living" religions provides us with a vivid paradigm of how the experiential science of truth-concepts can actually have practical value. It provides both a way of conceptualizing our cultural differences, and the first step in the process of resolving or reconciling them.

We must not expect too much, of course. The principal virtue of Hegel's science in its practical bearing is negative. It shows us why disagreement and conflict are bound to persist, and how creatively imaginative the task of conceptual reconciliation is bound to be even when the will is there. In the sphere of "objective Spirit" (i.e. the sphere of "Law" in all its forms, positive, natural and moral) disagreements are formulated in terms of conflicting "rights"; but quite apart from conflicts between levels of social life (e.g. family and city) Hegel's analysis of the concept of justice (par. 430) shows why a consistent and universally recognized system of "rights" is impossible. So in our dealings with socially contentious questions such

as abortion (for instance) we are doomed to go on making compromises that satisfy neither side, unless and until the conflicting attitudes move towards reconciliation at the immediate level of feeling (or “insight”).

To a cultured moral disposition these supposedly useful “applications” may appear to be elementary common sense. That is what the theory itself predicts, and that is what is desirable. But for those committed “religiously” (or at the level of the ethical identity of “character”) it will not be so; for them, the science can only lay out the conditions for understanding (either mutually or on the part of the observer). It is only in historical comprehension that the rule of “forgiveness” can be universally applied. The “Science” of experience is ultimately for the self-enjoyment of the universal self in its “essential” community.

2. *Is the Science of Experience a Proper “Science”?*

When Hegel sent his new-printed book to Schelling in May 1807 he spoke of it as the “first part” of the system, which was “properly the Introduction.”² This is to be understood in the general context of the “absolute idealist” position according to which the “first and last thing,” the “Thing itself,” is a real identity of Being and Thinking within which everything finite is comprehended. If we take the “Thing itself” to be what is first, then the *Phenomenology* must *properly* be the *introduction* to philosophy and only that; it leads us up to the right understanding of how our finite experience lives and moves in that absolute identity, and there it stops. To be a logically convincing *introduction* was its designated function in the economy of the Absolute Identity, which Hegel and Schelling had been expounding and defending together for six and a half years. It was a marriage of the logical and the historical approaches that Hegel had tried over the years. Having completed it, Hegel was himself ready to present the system of Absolute Knowledge. Serious students of philosophy would now be able to understand what he and Schelling were doing. The Absolute was no longer being “shot from a pistol”; and those who wanted to “know” it need not be sent to the asylum.

According to the argument of the book, the absolute standpoint of “pure thought” is born of our religious experience, when our religion is seen as the only rational resolution for the problems that arise from the “freedom of conscience” (which is the final shape of “freedom of thought” as the element of personal self-expression). It is, of course, the public law that sets the bounds within which all consciences are effectively “free.” A conscience that is in conscious opposition to the universally recognized authority of the law—one that sees itself, or would like to see itself, as the “Law of the Heart”—must choose between the public sanction (which may go as far as the guillotine) and self-incarceration in the Stoic thought-world. But the religion of loving forgiveness sets up “the Law of the Heart” in its only demonstrably rational guise, as the regulative ideal for our system of public law. The final object of the legal system must be to bring everyone (offenders and offended, agents and observers alike) into the community of rational reconciliation, and to maintain them there. Thus, if it is the law of someone’s Heart to execute the

fatwa against Salman Rushdie, they will certainly learn that this cannot rationally be the “law of all hearts.” But if someone aids a fugitive from political persecution (generally recognized as a victim of persecution) then the appeal to the “law of the Heart” will be allowed as *rational*, however ineffective it may prove in the immediate circumstances of the moment.

The standpoint of Absolute Knowing takes the place of the religious standpoint. “Speculative Philosophy” was (and indeed is) a kind of “religion.” That is one reason why its proponents are apt to become passionate and to indulge in *odium theologicum*—or at least to be quietly contemptuous of those who are called “philosophers,” but who do not appear to be concerned about anything absolute. But, of course, there is no need for these negative passions in philosophy at all, and the philosophical “beautiful soul” must understand that its contempt (however silent) remains contemptible.

The one clearly logical consequence that follows from the transition to the “absolute standpoint” is the recognition that we cannot appeal to God as a “judge.” For in that capacity we cannot speak for him. The final overcoming of the Unhappy Consciousness lies in the rational comprehension that “God *cannot* judge, he can only *have mercy*”;³ and that means that (although social authorities will no doubt continue to avail themselves of it) the death-penalty cannot be made finally rational. Dr. Guillotin was attempting the impossible; for Reason requires that its channels of communication must remain as open as we can keep them. We cannot allow anyone who executes a *fatwa* to argue that they were “only sending the offender to God.” Not even from the mouth of an acknowledged saint of the purely academic life (such as Thomas) can we accept that argument. The believers may ascribe to their God any other “Beyond” that they wish (in uses of language which they acknowledge to be rationally unintelligible by the standards of “scientific” communication); but a “judge” God cannot be. The standards of rational communication have to apply to anything properly called a “judgment.” The Stoic concept of “free thought” obliges us to admit that death can be a right of the rational individual; and it may therefore be an appropriate gift sometimes, for those who lack the power to exercise their rights. But death cannot be a rightful punishment.

The fact that we cannot judge for God (because he cannot be a “judge” in practical affairs at all) may make it seem problematic whether we can actually think for him. If the “science of experience” is a science at all, perhaps it should be read as the demonstration that no further science is possible? Why should theoretical judgments be in any better case than those of practical life? Is it the case that we can reach the absolute standpoint only for the retrospective enjoyment of all of the experience that led up to it?⁴

Clearly Hegel did not himself believe this, or he would not have described his book as “properly the Introduction.” I shall not discuss the problem at any length here, because my necessary concern is with whether that “introduction” is also a science. But the relation of our putative science to “experience” in its ongoing character enables us to offer some tentative suggestions (rather than definite conclusions or proofs).

First, no one has to be “logical” in the Hegelian way unless they want to. What Hegel calls the “leading of language” is a light and easy yoke. One can refuse it at the very beginning, and stand by the practical reading of experience that we call “common sense.” We may need to distinguish “science” from common sense; but we can still accept the practical “life-efficiency” standpoint of common sense as the overarching context within which our scientific inquiries “make sense” (including all of our inquiries into the logic of language, and the rational psychology of selfhood).

So, if we are going to be logical in Hegel’s way, if we are going to follow the leading of language, we must know why we are doing it; for otherwise we shall be derailed somewhere by the insurgent pressures of the ordinary life that is lived in accordance with the dictates of common sense. Speaking generally, we must already desire to be “another self” than the one that is focussed upon the self-preservation of a handy, language-using, middle-sized mammal which is, above all, *crafty* in the securing of “its own way.” The exigencies of self-preservation already compel us to form ourselves (as language users) at least into the appearance of “another self” who is socially defined; and the highest reaches of our craftiness become visible in our capacity to deceive ourselves about our identity with that other self. That is why it is questionable whether we can really *be* “another self”—without dying to demonstrate our success. Language leads us on a “pathway of despair” because at every stage—if our concept of honesty is still bright—we know that we are hypocrites in speaking of a “truth” that is our “identity.”

The fact that life itself forces the language-using social animals to embark upon the task of remaking themselves—i.e. remaking their consciousness of the goal of their lives, which is primitively given to them as self-preservation and self-reproduction—is what gives Hegel’s undertaking some measure of plausibility and attraction for everyone with theoretical interests.⁵ But Hegel’s enterprise remains only a language-game—or at best a technique for doing psychological and social analysis—for all who are not already strongly inclined to take a “religious” view of their lives and vocations when they read him. The “pathway of despair” is only a primrose path full of sceptical laughter, and a comedy that is occasionally rather black, unless we seriously believe that we must strive for union with God, and that only by doing that shall we become our true selves. When we have *that* attitude we can understand at once why *any* view founded upon “common sense” is likely to be “false” and “upside down.”

Hegel was educated in a seminary, but he was not particularly religious personally; or at least I cannot see any evidence of it. The “despair” of which he speaks is a matter of historical observation. It is Augustine, not the Sceptical professors, who expresses the “unhappy” experience of the *Weltgeist* adequately. The task of history, in bringing philosophical consciousness to maturity, is to overcome Augustine’s despair really and truly. But it belongs to philosophy professors to be sceptical, just as it belongs to ordinary unphilosophical folk like the slave in Terence to be comically amused, and entirely friendly to the life-spectacle that amuses them. The “phenomenology of Spirit” is a pathway of despair; it ends tragically at the Mount of Calvary, with the experience that cannot fail to produce despair in every one of

us who has honestly abandoned the faith in an unintelligible Beyond. Our finite lives are bounded by death.

That we must accept; and Hamlet was right—no one in my lady's chamber is going to laugh at it. But the "experience of consciousness" is a comedy all the same. Despair belongs to the finite spirit, and to religion. But the experiential science is also a "self-fulfilling scepticism" (par. 78). When we advance into the infinite freedom of the philosophical realm, we leave despair and the tragedy of finitude behind; it is the spirit of comedy, the *liberated* spirit of the Sceptical professors, that must go with us.

Hegel laughed at the "modern" sceptics, just as Kierkegaard laughed at the Hegelian professors and their "System"—and for similar reasons. He saw that the modern sceptics were not really sceptics at all. Even in their theoretical arguments they took everything established by "modern science" for granted. Their scepticism was a verbal pretence. Similarly Kierkegaard, who knew what the despair of finitude was, and wrote about it more vividly than anyone had done before (at least since the birth of the modern scepticism), saw that "the System" was a house of words, which gave knowledge of nothing important. It was only a sham substituted for the religious tradition that it claimed to replace.

Kierkegaard is the "shape" of *true* Scepticism in the modern philosophical age. He draws attention to what philosophy cannot do for us. Philosophy cannot tell anyone how to be "authentic."⁶ Hegel's theory of Conscience shows that it must be the standing assumption of our lives together that everyone is as authentic as they know how to be. All "conscientious" declarations are to be accepted as valid; and everyone is to be forgiven for their failures, and for the necessary element of self-assertion and self-will involved in their decisions. Since most of us are not philosophers, it is correct to call this the "absolutely religious" foundation of our political life. Anyone, pretending to be a philosopher, who claims to show us the way to a more authentic mode of existence—whether it be Marx preaching the International, Gentile preaching the "educational" value of the Fascist blackjack, or Heidegger preaching the gospel of "German destiny"—is *betraying* the philosophical calling.⁷

In so far as the Hegelian doctrine of conscientious forgiveness permits us to take the attitude that Heidegger stigmatized in *Sein und Zeit* as that of *das "Man"* it is an easy yoke. To appeal to what "one" does or thinks, is to avoid having any conscientious position of one's own; but as soon as one has a real commitment of "the Heart," the path of "forgiveness" becomes as difficult as Kierkegaard says it is to be a "Christian." Kierkegaard, the existing individual, is the Hegelian Conscience that takes itself seriously. So we must leave him behind. When we go on to "absolute knowing" it is Carneades and the slave in Terence whom we take with us into the purely theoretical aether of "the System."

Of course, Kierkegaard, the thinker, was the complete figure of the Sceptic.⁸ He knew how to speak for Carneades and Terence too in their place. Let us begin with his wish that he could improve on the "tolerably dubious Hegelian arrangement of the historical process."⁹ It was someone who *did* believe in Hegel's *Logic*

(McTaggart) who demonstrated the truth of Kierkegaard's claim that "to exist under the guidance of pure thought is like travelling in Denmark with the help of a small map of Europe, on which Denmark shows no larger than a steel pen-point."¹⁰ McTaggart commented that "the beginning [of the Philosophy of History] is quite empirical"; and the openness of its ending left him believing that in the *Philosophy of Right* "Hegel passed to the conclusion that the best that had appeared was the best that could appear."¹¹ Of course, McTaggart's essentially "Kantian" view that Hegel had produced a transcendental logic for "application" to "reality" was quite mistaken. But the uselessness of the Logic as a "map" could not be more graphically illustrated.

If we turn to the *Phenomenology* for the fixing of our compass points, we can readily see that Imperial China has no more place in the "tolerably dubious Hegelian arrangement" than Kierkegaard's recently discovered tribe in "Monomotapa." Hegel's *Logic* is not meant to be "applied" to anything and everything—in the way that it was by McTaggart and all the *Privatdozenten* that Kierkegaard loves to make fun of. There would be no end to that; and since all the "empirical" material is only "approximately" conceptualized (as Kierkegaard puts it) none of the results would be satisfactory. But even when it is *correctly* interpreted, there is a "bad infinite" aspect to the logic of the concrete. Concrete logic is capable of infinite extension; and the most we can hope for is some convincing way to fit every piece of valid conceptual analysis done in any "finite" field into Hegel's conceptual theory. But nothing can be fitted into it properly unless we understand where the backbone of Hegel's logical enterprise is located.

The backbone of Logic is what the *Phenomenology* can show us. The appearing of the Spirit has led us to a conceptually visible "universal Church" of rational appreciation. What the philosophers (as the thinking consciousness of this community "for itself") must supply first, is the logical structure of this community and of membership in it. The Hegelian Logic is, first of all, the theoretical structure of rational selfhood. In that aspect it is the foundation of the scientific comprehension of the world in the "Real Philosophy" of Nature and Spirit.

The Real Philosophy logically involves an indefinitely extensible conceptual scheme); so in its "real philosophical" aspect the Logic is infinitely expandable; and in addition, it will be continually in need of reelaboration and revision. It is ironically amusing to find in the first volume of the *Collected Works* of Marx, three drafts of a structural analysis of Hegel's *Philosophy of Nature*.¹² For the *Philosophy of Nature* was already beginning to lose its utility (and so fall into undeserved disrepute as a project) even while Marx was making his abstracts. The reason that Hegel's Logic is not threatened with the same general desuetude is that its "backbone" has to be a philosophical system of the concepts that structure our common-sense experience and communication. Only when (and if) the advance of science and the transformation of our lives were to cause changes in the most ordinary uses of our most ordinary concepts would Hegel's own version of the Logic become superannuated. If that were to happen we should be able to see clearly what is truly "absolute" about the "Absolute Knowing" of the *Logic* itself; for we should have to

use the “method” of the *Logic* phenomenologically in order to comprehend Hegel’s own *Logic* historically.

If we look at Hegel’s “System” in this perspective, even the freaks and excesses of his *Philosophy of Spirit* became comprehensible. It was “logical” to show how the summary outline of Chinese culture and religion readily available to an educated German in 1825 typified a very undeveloped form of social “substantiality.” But both the lecturer, and his students, probably thought that this constituted a rational justification for cultural imperialism on the part of the European nations. The voice from the “penpoint” of Denmark suggesting that the Chinese—and even the still undiscovered tribe of Monomotapa—were children of God with lives of their own, was only bringing out what is implicit in paragraphs 678–680 of the *Phenomenology*. We must rejoice that it spoke up.

The question that this example raises is whether some subtler form of prejudice is present even in the most ordinary and universal concepts themselves, as they function in the mind of one who devotedly seeks to escape from prejudice. Hegel was certainly inclined to rationalize the common prejudices of his place and time in practice. Even his admiration for Antigone forms part of an apologia for the “Church, kitchen and kids” conception of woman’s role in the rational life. But although that conception was shared by the society of Sophocles and Hegel’s own world, Hegel did not believe (as Sophocles clearly did) that Antigone was wrong to act like an equal in her “brother-sister” relationship. His un-Hellenic idealization of the brother-sister relationship only makes sense in the context of the Christian Kingdom of Heaven; and that is translated out of the Beyond, into the Here and Now by the “absolute Religion” and “absolute knowing.” So the fact that Antigone is one of the saints of the visibly-invisible Church is a proof that theoretical Reason can rise above the reconciliations with “necessity” that typify “Real Philosophy.”

There may *be* prejudices in the *Logic* nonetheless. For as Kierkegaard put it: “Who is to write or complete such a system? Surely a human being.” It is indeed a “strange mode of speech which assumes that a human being becomes speculative philosophy in the abstract.”¹³ First we are up against the ambiguity of the word “abstract” here. Hegel does not hold that words have meanings (or “concepts exist”) in the abstract at all. A word has meaning *for* a speaker, hearer, reader; a “concept” is the actual activity of grasping the meaning. Properly, words have meaning (or concepts exist) when the circle of communicative interaction shows that the conceptual meaning is shared in common by a community of speakers, hearers, readers. When what is shared is entirely linguistic, when the words refer only to other words, the concepts only to other concepts, then the thinking is “pure.” At this stage a speaker or writer who submits her results to the community of others who practice “pure thinking” in that language (and so establishes that communication is actually occurring reliably) can reasonably aspire to do “speculative philosophy as such.” But she will not have securely escaped from all prejudice even so. For she must use her own natural language; and we cannot tell what subtle biases there may be in that. Only time, communication with other cultures and languages, and diligent critical attention will reveal them.¹⁴

Abstract perfection is not achievable because the ideal of “perfect communication” is not “abstractly” definable. “Perfect communication” must be concretely defined as necessarily involving the moment of critical doubt and uncertainty. Our sceptical conscience—or perhaps better, the laughing consciousness of the jester—must go with us always. The *concrete* ideal of rational communication is a system that *works*. That is to say it produces a sufficient degree of “satisfaction” on both sides to keep itself going. In practical affairs, this often involves deliberate ambiguity. Antigone and Creon we have always with us; the philosophical comprehension of how rational communication works can only lead them to accept their disagreement knowingly as “necessary.” Ambiguous formulas avoid actual conflicts. In empirical science, however, the goal is to avoid any misleading ambiguity; and for that reason logic must expose conceptual ambiguity in all of its *necessary* shapes. The rational structure of selfhood, the paradoxical union of singularity and universality in “membership,” the “identity” of “the We that is I and the I that is We”—these are the key to what is “logically necessary.” This, therefore, is the core and centre of philosophical logic; and it is safe from the continual change and transformation that must rule at the periphery of rational inquiry because the structure of our life experience will not change. Whatever may happen at the level of the scientific Understanding, we must continue to live in the world of Sense-Certainty and Perception, the world of common sense and “real life” in which we struggle to assert ourselves, and then collaborate in a system of (debatably and contentiously) “equal recognition” to make ourselves at home in the world, and to build up all the structures of objective Spirit that the “good life” (which may appear to us to be shockingly *bad*) requires. Wherever our scientific conceptualization of Nature (universal and “human”—or particular) may lead, the necessary inversion of the scientific Understanding is bound to restore the primacy of the standpoint of “life.” The reliable permanence of philosophical logic depends upon the necessary primacy of common sense; and that primacy means that—in defiance of common sense itself—even the *universal* concept of Nature is really “human.” That is the ultimate significance of the “Inverted World”; and the certainty that philosophical logic is indeed possible depends upon it.

It is by now clear, I trust, why the “science of experience” must be possible, and how we can be sure that Hegel has the fundamentals of it right. Starting from its two ends, I have shown why they are functionally necessary—and, more importantly, why their connective closure is necessary. Those who think that the Hegelian “System” can stand without its *coordinate* “First Part” are either confused about what the Hegelian logic *is*, or else so commonsensically comfortable in their possession of the point of view of modern scientific Reason that (although they know it is *essentially* “historical”) they see no need to inquire how their secure possession of it was achieved. The second case was Hegel’s own during the Berlin years of his universally recognized “authority.” He would have recognized his mistake fast enough if he had lived to hear Kierkegaard telling the Danish professors that “the System” leaves out “the ethical.” It is rare to find someone in the first case who has thought hard enough in a critically reflective way to recognize her own state of confusion.

Mure deserves our honor and respect for recognizing and admitting to it.¹⁵ Most interpreters of the *Logic* are content to go on studying and writing about Hegel as a link in the great tradition of speculative theology as if Kant had not *successfully* established that the status of that whole tradition was radically problematic, and as if Hegel's expression "God's knowledge" was directly convertible into "the knowledge of God." Michael Rosen (1982) has shown what becomes of "God's knowledge" as a supposed form of intellectual "intuition." But no doubt intellectual fantasies meet the same sort of abiding need for some intellectuals (McTaggart can serve as a paradigm, since he is safely dead) that imaginative fantasies do for more ordinary folk. So I suppose that the tradition will continue.

For those who think that the only God worth seeking, cannot properly be found "beyond and above," because that God himself leads us back home to those who made him, and made themselves into a rational community by making him—so that they can rightfully say that (logically) "He" made them able to make both themselves and him—for this constituency the *Phenomenology* remains essential. They will readily grant, I think, that the ends of the circular chain are sound enough. There is no need to claim that Hegel's performance is perfect all the way; and there are some grounds for arguing that in the middle it is susceptible to significant improvement. The chapter on "Reason" is terribly bloated in its first stages, and unduly starved and meagre at the end. The reason for the bloating becomes apparent when Hegel returns to the topic of "formalism" in the Preface. We can see there, that his indignation about the easy "empirical" way of connecting speculative logic with the order of Nature was one of the main stimuli that drove him to give a philosophical account of "experience." So it is no wonder that his pen ran away with him when he came round to "formalism" in his systematic progress. His repetitively tedious proof that the empirical observation of nature is logically helpless, obscures the deeper and more important point that even in its best formulations the experimental theory of nature will only teach us what it taught Socrates—that nothing of concrete human significance is to be learned there. Hence the "philosophy of Nature"—even when it is done properly—will prove to be far less significant in "the System" than the speculative "theologians" (and particularly Schelling from 1796 to 1806) believed.¹⁶

Hegel continued to indulge the vein of sarcastic mockery set free by "Schelling's school," in his critique of Lavater and Gall. This (also) became far more extensive than it needed to be, simply because he was enjoying himself. The account of rational self-realization is more appropriate in scale and is methodically well done; but then, at the end of the chapter Hegel was certainly conscious that he had already gone on far too long so he skimmed on his dialectic of practical reason, just as he had already made "logic" no more than the Danish penpoint on his map. I do not think that he could have done "Lawgiving Reason" properly without a lengthy excursus (but how much more worth having it would have been than that endless rigmarole about "the Inner and the Outer"!). There is perhaps a sound argument for making both theoretical Reason and the Categorical Imperative into penpoints. For the transitions are really "immediate." They depend upon

an “identity of opposites” that make common sense intensely uncomfortable; and “methodizing” them more fully (which was certainly possible in the case of “logic”) would not make them any easier.

It cannot be denied that Hegel’s ladder bears a closer resemblance to the fence built by Kullervo, son of Kalervo (in the *Kalevala*) than it does to the ladder that Dante saw in Paradise:

Kullervo, son of Kalervo, now makes a fence.

He places big pines as palings just as they were, whole tall firs he sets up as posts; he pulled withes good and hard from the tallest rowans, made a fence without an opening, made it quickly without a gate.

Then he uttered these words, spoke and said this:

“Whoever does not rise aloft like a bird, not fly along with two wings,
Let him not get over the fence of Kalervo’s son.”

Untamo chances to come to view

that fence of Kalervo’s son, the slash felled by the war slave.

He saw a fence without an opening, without a chink, without a slit,

a fence which was built up from the ground, constructed up to the clouds.

He uttered a word, spoke thus: “He is not fitted for this;

he made a fence without an opening, built it without a gate;

he raised it up to the heavens, raised it up to the clouds.

I cannot get over it or inside it through a chink.

I do not know what to apply him to, to what work I should put him.¹⁷

But on the whole, I find Hegel’s argument methodical enough; and I am content to stand by the verdict that his “science” is a success: “a work . . .” (said Peirce) “perhaps the most profound ever written”—and C. S. Peirce was then (1903) already the *next* true giant of philosophical logic.¹⁸

Notes

1. Compare Hegel’s introduction to the *History of Philosophy* (ed. Hoffmeister, 177): “The subjective spirit that is rationally aware of (*vernimmt*) the divine Spirit, is itself this divine Spirit” (mistranslated in Lauer 1971, 107). This is only one of a number of similar aperçus.

2. Letter 95, May 1807 (Hoffmeister, I, 161–162; Butler and Seiler, 79).

3. Rosenkranz, 193 (Harris and Knox, 265).

4. The last pages of T. Pinkard (1994) seem to be supporting this view.

5. Passion being the dialectical force that it is, this plausibility and attraction can lead to violent rejection. Thus Popper’s “experience” reinforced his commitment to “rational common sense”; and recognizing that social identification could lead to death-camps on one side, and the “liquidation of the Kulaks” on the other, he blamed Plato, Hegel and Marx for things that all three of them abominated as much as he did. The attraction of the ideal which all three—in their different ways—perceived and portrayed, can best be measured by the

ways in which Popper falsifies and distorts it *for himself* in order to validate his hatred and contempt. (He was very obviously wrong in thinking that Hegel wanted to predict the future direction of history. But his argument that we cannot predict the future direction of *knowledge* (1964, vi–vii) has to be taken more seriously.)

6. This is the only way in which Kierkegaard's complaint against Hegel can be *validly* formulated; and we should take note that the philosophical conscience who passes on to "Absolute Knowing," must have accepted the duty of being the best *individual* she can be before she can make the transition to being a "pure thinker." *Real* forgiveness never comes cheap. But the paths to "authenticity" are indefinitely various; they cannot be *systematized*. All the same, a "moral philosopher" who elects to study them can sometimes be seen to be (from the absolute standpoint) "on the right track." This is the case, for instance, with Iris Murdoch (1993) who finds the "metaphysical" ground of "morals" in a religious experience that has become philosophically undogmatic. (She is, of course, quite mistaken about the Hegelian Absolute. When she finds in it "a lingering shadow of determinism, and the *loss of ordinary everyday truth*" [490] it is apparent that she has substituted the general impression of Hegel's "influence" for the study of what Hegel himself says about "Absolute Knowing." Anyone who studies the last chapter of the *Science of Logic* can see that "Absolute Knowing" has nothing to do with the metaphysical fantasies of Bradley or McTaggart; and if the view of the *Science of Logic* proposed here is accepted, it will become evident that the *pedagogical* aim of Hegel's system was very close—Platonically "identical"—to Murdoch's own.)

7. The "betrayal" has many different degrees. Thus (in spite of the rhetoric of "class war" with its echoes of the Sans-culottes and their "Scythe of equality") we can fairly claim that the educational efforts of Marx and Engels themselves did not violate the principle of "respect for Conscience." They were mistaken in thinking their "science" was *philosophical*; but it was only when their "social science" lost its enlightened character as a universal gospel, and became the *instrument* of an authoritative elite, that a new breach between "philosophy" and "religion" was created. Lenin's "dictatorship of the proletariat" is the "Unhappy Consciousness" of the Marxist gospel—just as Gentile's ideal of the Fascist "Regime" was the Unhappy Consciousness of a religion of the Hegelian "Nation." The Nazi "Nation" was not Hegelian at all; its rhetoric belonged to the "animal religions." What is to be said about a philosophical position that could allow Heidegger's choice, I do not know. But anyone who can *rest* in a position from which that choice appears somehow legitimate, seems as remarkable to me as Abraham did to Kierkegaard. (Unlike Kierkegaard I would not *admire* Abraham, if I did not believe that the ram in the thicket was the work of his own intelligence rather than the miraculous gift of his God. Otherwise, like Heidegger, he simply represents the *risk* involved in an "immediate" commitment.)

8. For two different attempts to relate Kierkegaard and Hegel see R. L. Perkins (1982—brief) and M. C. Taylor (1980—lengthy). J. L. Marsh (1982) is right in pointing out that Perkins has overlooked Kierkegaard's enormous debt to the "Unhappy Consciousness." See also J. W. Elrod (1975). The life-work of N. Thulstrup (1980) is invaluable for all matters of fact, but far less insightful about Hegel's "system" than Kierkegaard himself was in all but his most polemical moments.

9. S. Kierkegaard (1941), 135.

10. S. Kierkegaard (1941), 275.

11. J.M.E. McTaggart (1896), 245–246. McTaggart thought that Hegel's willingness to discuss China, India etc. was a sufficient answer to "Lotze's reproach that modern Idealism confined the spiritual development of the Absolute to the shores of the Mediterranean"

(Lotze, *Metaphysics* sec. 217). If he had appreciated the justice of the “reproach” he might eventually have understood Hegel better.

12. See K. Marx (1975), Vol. I..

13. S. Kierkegaard (1941), 109 (my italics).

14. The understanding of “Spirit” as the human communication process, began (I think) with Josiah Royce’s *Problem of Christianity*, vol. II (1914). But it is now quite general. See, for instance, M. Theunissen (1978). (I am not sure whether this version of “open Hegelianism” is “open enough” to satisfy the requirements of D. Kolb [1991]. But regardless of what the historical Hegel, with his secure Newtonian foundations, may have thought, it will be seen that on my view, the *real* philosophy of Nature must remain a radically “open” field of inquiry. In the transition from Logic to Nature the crucial expression is that the Idea “lets itself go *freely*.” Unlike Kolb I do not find myself agreeing with S. G. Houlgate *against* John Burbidge [both 1990] but with both of them *together*—which means that a reconciliation of their views is both necessary and possible.)

15. See G.R.G. Mure (1978), 147.

16. This was, I think, the right view about an Aristotelian contemplative philosophy of nature in the conceptual context of Kant’s Copernican Revolution; and a contemplative view was the only one possible in Hegel’s time. In that context only the “breach” between Nature and Spirit was humanly (or “ethically” as Kierkegaard would have said) important. In the context of our *evolutionary* theory, the continuum between Nature and Spirit becomes vital, and the “ethical” significance of the Philosophy of Nature is both positive and immense. That is another reason why Hegel’s chapter V A leaves us dissatisfied and unhappy (and not just bored). But it is not a reason why the *Phenomenology* needs to be revised or amended; it only illustrates how the forward movement of experience—even a revolutionary movement—does not affect its logical structure.

17. *The Kalevala* (poem 31), trans. Francis P. Magoun, Cambridge MA, Harvard, 1963, 227.

18. MS. 478, 27 (Houghton Library, Harvard). Like most of Hegel’s other Anglophone admirers, Peirce saw no virtue in the dialectical method in pure logic. So his view that the *Phenomenology* is Hegel’s “greater masterpiece” (*Collected Papers* 8, 112) is prejudiced. But I think the *Phenomenology* really is “more profound”; I have tried to show *why* in this concluding essay. In general, however, I think that comparisons are odious here, because the two “masterpieces” ought never to have been separated—and I have tried to demonstrate that too. When they are separated, the Logic comes to seem “more profound” to some, and evidently useless, or even a deliberate humbug, to others; while the *Phenomenology* loses most of its profound seriousness, and reveals its comic-ironic side. It is then torn to pieces by the spiritual children of Kierkegaard and Nietzsche; and Hegel himself is as much to blame for that as those later heroes of the spirit. (I cite the Peirce MS. from the quotation in M. H. Fisch [1974, 183].)

The foundation of philosophical logic in the life-world of ordinary usage is essential because we must avoid the “illusion” of which Wittgenstein speaks:

We are under the illusion that what is peculiar, profound, essential, in our investigation, resides in its trying to grasp the incomparable essence of language. That is, the order existing between the concepts of proposition, word, proof, truth, experience, and so on. This order is a *super*-order between—so to speak—*super*-concepts. Whereas, of course, if the words ‘language,’ ‘experience,’ ‘world,’ have a use, it must be as humble a one as that of the words ‘table,’ ‘lamp,’ ‘door.’

This same ordinary-life foundation makes Hegel's *Logic translatable*—though with minor problems illustrated in Geraets, Suchting and Harris (XIII–XLVIII). The claim of H.-G. Gadamer (1976, 112) that “all attempts to translate his [Hegel's] thought are utterly futile” is amusingly absurd. But any Anglophone reader will agree that J. Derrida's claim that Hegel's discourse “still holds together the language of our era by so many threads” (1982, 119) goes a bit too far the other way. It is not Hegel's actual *language* that has this remarkable function.

Bibliography

1. The Philosophical Tradition Before Kant

Note: This section contains only works referred to in the text. Full publication data is given for books and articles that I have used myself. For the editions used by Hegel, I have given whatever details my sources supply.

- Abelard, P. (1971). *Ethics*, text and translation, ed. D.E. Luscombe, Oxford, Clarendon, 1971.
- Allison, Henry E. (1966). *Lessing and the Enlightenment*, Ann Arbor, U. of Michigan Press, 1966.
- Aristotle. *Complete Works*, ed. Jonathan Barnes, 2 vols., Princeton NJ, Princeton University Press, 1984.
- Arnim, E. von (ed.) (1903). *Stoicorum Veterum Fragmenta*, 4 vols., Leipzig, Teubner, 1903–24; reprinted, Dubuque Iowa, W.C. Brown, n.d.
- Arnold, E.V. (1911). *Roman Stoicism* (1911); reprinted, New York, Humanities Press, 1958.
- Augustine (1948). *Basic Writings*, ed. W.J. Oates, 2 vols., New York, Random House, 1948. (Latin and English texts together will readily be found in the Loeb Classical Library.)
- Bacon, Francis (1905). *Philosophical Works*, ed. J.M. Robertson, London, Routledge, 1905.
- Boehme, J. (1960). *Aurora*, trans. J. Sparrow 1656, ed. C.J. Barker and D.S. Hehner, London, Watkins and Clarke, 1960.

2. From Kant to Hegel

Note: Here again I give full details for the modern editions that are available, and such information as I have for the publications of Hegel's own time.

Baillie, J.B.: see Hegel, *Phenomenology of Mind*.

Beck, Lewis White: see Kant.

Beiser, Frederick (1987). *The Fate of Reason*, Cambridge MA, Harvard University Press, 1987.

Beiser, Frederick (1992). *Enlightenment, Revolution and Romanticism: The Genesis of Modern German Political Thought, 1790–1800*, Cambridge MA, Harvard, 1992.

Bichat, Marie François Xavier (1800). *Recherches sur la vie et la mort*, Paris, an VIII.

Bonnet, Charles (1770). *Analytischer Versuch über die Seelenkräfte*, trans. by C.G. Schütz, Leipzig, 1770.

Bonsiepen, Wolfgang (1979). "Erste Zeitgenössische Rezensionen der Phänomenologie des Geistes," *Hegel-Studien* 14, 1979, 9–38.

Breazeale, Daniel: see Fichte (1988, 1994).

Brown, Robert F. (1977). *The Later Philosophy of Schelling*, Lewisburg PA, Bucknell UP, 1977.

Burbidge, John W. and Di Giovanni, G.: see Hegel (1804–5).

Butler, Clark: see [Hegel] *Conversations Lexicon*.

Butler, Clark and Seiler, Christiane: see Hegel, *Letters*.

Cerf, Walter and Harris, H.S.: see Hegel, *Faith and Knowledge*.

Chisholm, Roderick M.: see Fichte, *Vocation of Man*.

Crouter, R.: see Schleiermacher F.D.E.

Cuvier, Georges (1817). *Le Règne Animal*, Paris, 1817.

De Jager, Timothy (thesis, 1991). *G.R. Treviranus (1776–1837) and the Biology of a World in Transition*, Ph.D. thesis, University of Toronto, 1991.

De Negri, E.: see Hegel, *Fenomenologia*.

Di Giovanni, G.: see Jacobi.

Di Giovanni, George and Harris, H.S. (trans. & annot.) (1985). *Between Kant and Hegel: Texts in the Development of Post-Kantian Idealism*, Albany, SUNY Press, 1985.

Dokumente zu Hegels Entwicklung: see [Hegel] below.

Ellington: see Kant, *Metaphysical Foundations*.

Eschenmayer, A.K. (1803). *Die Philosophie in ihrem Uebergang zur Nichtphilosophie*, Erlangen, 1803.

Eschenmayer, A.K. (1805):

Der Eremit und der Fremdling. Gespräche über das Heilige und die Geschichte, Erlangen, 1805.

Fichte, J.G. (1801). *Bestimmung des Menschen*, *Werke* II.

Fichte, J.G. (1956). *Vocation of Man*, ed. R.M. Chisholm, New York, Library of Liberal Arts, 1956.

Fichte, J.G. (1978). *Attempt at a Critique of All Revelation*, trans. G.H. Green, Cambridge UK, Cambridge University Press, 1978.

Fichte, J.G. (1889). *Popular Works*, 2 vols., trans. W. Smith, London, Trubner, 1889.

Fichte, J.G. (1798). *System der Sittenlehre*, in *Werke* IV.

Fichte, J.G. (1897). *The Science of Ethics*, trans. A.E. Kroger, London, Kegan Paul, 1897.

Fichte, J.G. (1845–56). *Sämtliche Werke*, ed. I.H. Fichte, 8 vols., Berlin, Veit, 1845–56; reprinted, Berlin, De Gruyter, 1971.

(This is the edition cited herein. For critical texts consult *Sämtliche Werke*, Gesamtausgabe der Bayerischen Akademie der Wissenschaften, ed. R. Lauth and H. Jacob, Stuttgart-Bad Canstatt, Frommann, 1964–, which is still far from complete.)

Fichte, J.G. (1794). *Science of Knowledge (Wissenschaftslehre, 1794*, with the First and Second Introductions), ed. and trans. by P. Heath and J. Lachs, New York, Appleton-Century-Crofts, 1970.

Fichte, J.G. (1988). *Early Philosophical Writings*, trans. and ed. by D. Breazeale, Ithaca NY, Cornell UP, 1988.

Fichte, J.G. (1994). *Introductions to the Wissenschaftslehre, and Other Writings*, trans. and ed. by D. Breazeale, Indianapolis, Hackett, 1994.

Firchow, Peter (1971): see Schlegel, F.

Fries, J.F. (1805). *Wissen, Glaube und Ahndung*, Jena, 1805.

Fuss, P. and Dobbins, J.: see Hegel, *Three Essays*.

George, M. and Vincent, A.: see Hegel, *Propaedeutic*.

Goethe, J.W. von (1790). *Faust, Ein Fragment*, *Schriften* VII, Leipzig, Göschen, 1790.

Goethe, J.W. von (1808). *Faust: Der Tragödie*, Erster Teil, *Werke* XII, Tübingen, Cotta, 1808.

Goethe, J.W. von. *Faust*, prose translation by Barker Fairley, Toronto, University of Toronto Press, 1970.

Goethe, J.W. von. *Werke*, 22 vols., Berlin, Aufbau Verlag, 1972–8.

Goethe, J.W. von. *The Collected Works in Twelve Volumes*, ed. V. Lang, E. A. Blackall, C. Homlin, Princeton, NJ, Princeton University Press, 1994.

Goethe, J.W. von. *Wilhelm Meister's Apprenticeship*, trans. R.O. Moon, London, Foulis, 1947.

Goethe, J.W. von. [Eckermann, Peter] *Conversations with Goethe*, trans. J. Oxenford, London, Dent (Everyman), 1930.

Graeser, Andreas (1988): see Hegel, *Einleitung*.

Guttmann, J. (1936): see Schelling, *On Human Freedom*

Haldane, E.S. and Simson, F.H.: see Hegel, *Lectures on the History of Philosophy*.

Harris, Errol and Heath, Peter: see Schelling (1988).

- Harris, H.S. and Cerf, W.: see Hegel, *Difference* etc.
 Harris, H.S. and Knox, T.M.: see Hegel, *System of Ethical Life* etc.
 Heath, Peter: see Schelling, *System of Transcendental Idealism*.
 Heath, P. and J. Lachs: see Fichte, *Science of Knowledge*.

[Hegel: Titles of complete works are listed in alphabetical order; but fragmentary texts should be looked for under "Fragments."]

- Hegel, G.W.F. *Aesthetics*, 2 vols., translated by T.M. Knox, Oxford, Clarendon Press, 1975.

3. Secondary Literature on Hegel

My own references in footnotes will generally be found here. (I have given cross-references to the items in section 2 that might reasonably be looked for here.) But there are quite a number of items in this section to which no explicit reference is made (and some of them I have not myself seen). I thought it would be useful to readers of a work such as this to list everything (in English, French, German and Italian) that I know of. But I have been guided by the following boundary criteria:

1. The work should be fairly recent (not much is included that was written before 1960, unless its importance is generally recognized).
2. It should be *primarily* concerned with Hegel (and especially with the *Phenomenology*). Hence I have omitted some essays on Hegel and Marx (or Hegel and Goethe) for instance, because it seemed probable that they were more concerned with the other man.
3. The work should be fully published. I have omitted *theses*, except for a few to which I am myself directly indebted.

4. General References

Note: In this section I list the historical and literary works that are specifically referred to in the text (together with a few recent philosophy books that make no reference to Hegel). The literary works in French and German that were important for the evolution of Hegel's thought are given in section 2. *Classical* literature is here. But the English literary references, for which *any* decent edition will be good enough—e.g. Shakespeare—are silently ignored.

- Adams, Henry (1938). *Letters of Henry Adams 1842–1918*, Boston, Houghton Mifflin, 1938.
